Printed and published by the British Medical Association, at their Office, Tavistock Square, in the Parish of St. Pancras in the County of London.

NATURALLY RICH IN VITAMIN "D"

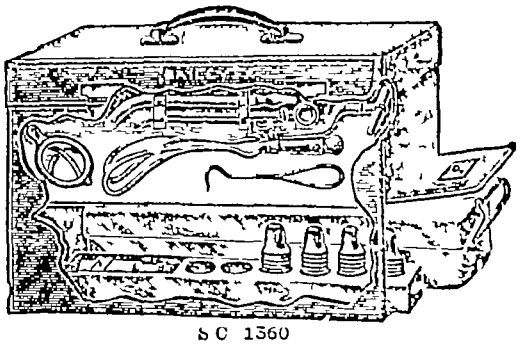
A RELIABLE BASIS

THE above chart shows the large fluctuations in the fat content of liquid milks throughout the year, as compared with the unvarying fat content of "Cow & Gate," which is based on the fat content of average healthy Breast Milk.

Fat content in "Cow & Gate" reconstituted (1 in 8), 3·4 per cent.
Fat content in average Breast Milk 3.3 per cent. to 3.5 per cent.

The fat content of raw milk also varies greatly from day to day. The time of day at which milking takes place also causes considerable variations.

This, in striking contradistinction to the standardized fat content of "Cow & Gate," and afford one of the many reasons why this food is the safest and most reliable alternative when breast feeding fails, and why it affords the most reliable basis for Infant Feeding Modifications.



Write for literature and a clinical sample of Cow & Gate

Cow & Gate Milkfood

Support HOME Agriculture. Cow & Gate Products are all made from ENGLISH MILK.

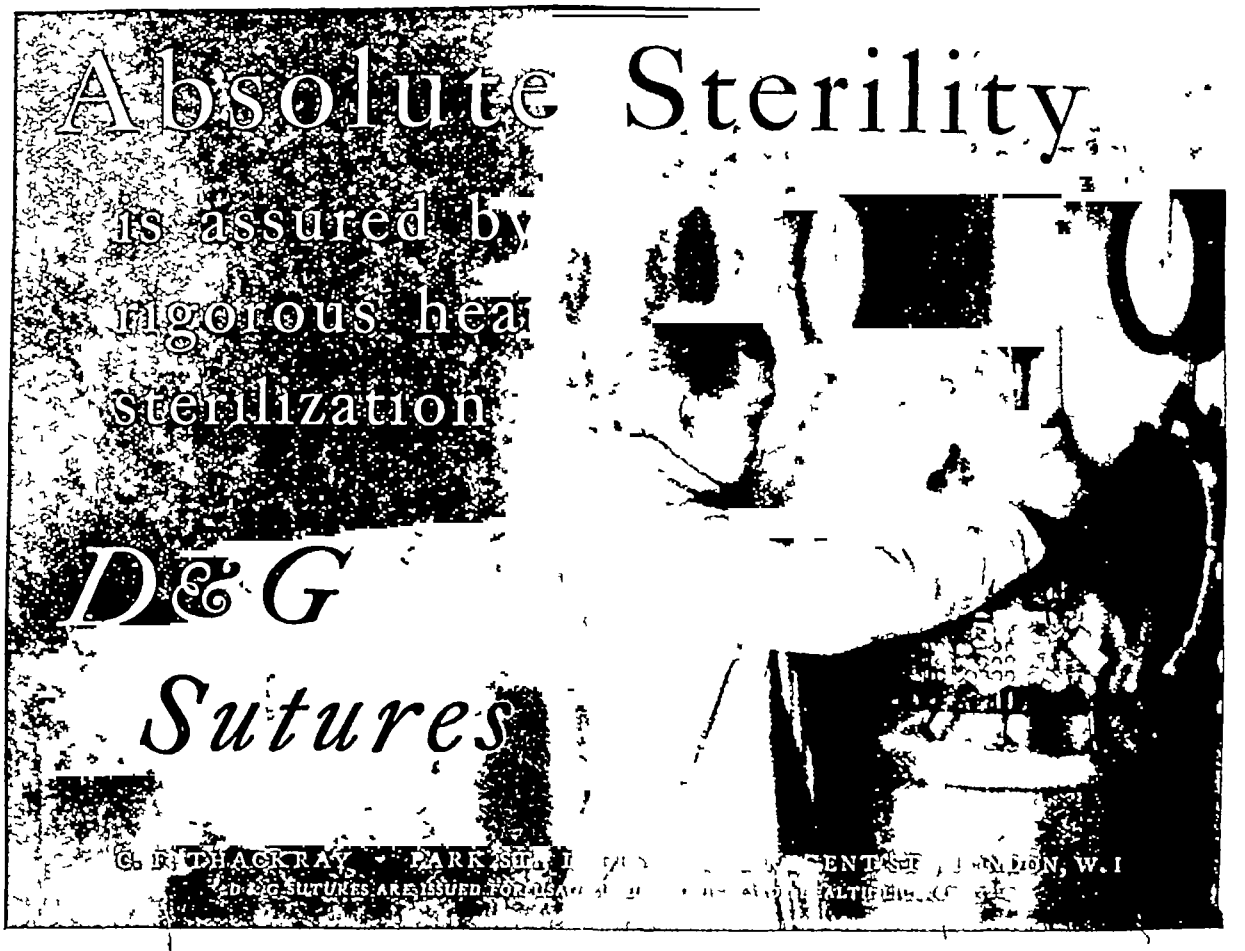
VENTRICULIN

(Stomach - Tissue Extract, P, D & Co)

A new specific for pernicious anæmia is offered in Ventriculin — a dry, granular palatable extract from fresh stomach tissue The remarkable potency of Ventriculin has quickly made it an outstanding preparation for the treatment of primary anæmia Its efficacy is assured by clinical tests as the material must be shown to contain the requisite degree of blood regenerating activity in order to be released for general use.



The usual dose of Ventriculin is 10 grammes daily for each 1 million reduction of the red blood-cells below normal. The maintenance dose is 1 vial daily

Ventriculin is supplied in packages of 12 vials each containing 10 gms Further particulars will be sent on request

D

The Therapeutic value of BRANDY–

its lifting and sustaining powers—as compared with other spirits depends on the presence or absence of the higher Alcohols or Ethers These in turn depend on Grape, Soil, Stills employed, Climate, Storage, Selection and Experience

It is quite easy to make a spirit from grape wine—It is neither easy nor cheap to make a Brandy containing the qualities you want.

Cognac Brandy alone provides them

Take no risks; ensure the results you expect

Prescribe Brandy distilled in Pot Stills from Wines grown in the best Cognac districts, Matured in warehouses which have been filled with Cognac Brandy for centuries, Made by Men with the inherited Experience of Seven Generations

In short—Prescribe MARTELL'S BRANDY

and know that you are doing the best possible for your patients.

WHEN YOU PRESCRIBE WARMTH WITH FRESH AIR

All medical men will agree that the practice of heaping thick, stuffy fabrics on the body to keep out the cold is merely increasing the risk of winter chills and influenza The skin needs ventilation—the impurities in the air round the body must be allowed to escape Fresh air must have access Perspiration must be absorbed That is why Jaeger underwear, made of pure Jaeger wool, is so often recommended as the healthiest underwear for all seasons All Jaeger underwear is treated against shrinkage. And there are Jaeger Agents in every town

YOU RECOMMEND JAEGER PURE WOOL UNDERWEAR!

"The Rose Corset-Belt"

for Accurate Abdominal Support and Comfort

Extract from the "British Medical Journal," Dec. 10th, 1927—

Visceroptosis is the cause of so much discomfort and ill health and an ill fitting or wrongly applied belt or corset may aggravate rather than diminish the subjective effects of this condition Madame Rose has for many years devoted special attention to this problem and we have good reason to believe that she has given help and comfort to a considerable number of sufferers We have received assurances from medical men who have sent patients to her that she gives personal attention to each patient that she takes great care in adapting and adjusting the support to the particular needs of the case."

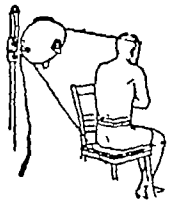
CANCER

On

December 6th a Special Number of the "British Medical Journal" will be published dealing with the treatment of cancer in various regions of the body by the agency of radium A selection of important papers bearing on this subject which were read at the Winnipeg Meeting of the British Medical Association in August, 1930, will be included, and there is no doubt that this issue will be of great interest to the vast majority of our readers

To meet the increased demand from all sources we are preparing to produce forty-four thousand copies instead of thirty-nine thousand as in the case of an ordinary number Many other interesting and informative items will be included, for every effort is being made in our Editorial Department to render this special issue worthy of its title in every possible way.

Special Numbers of the Journal always carry an enlarged section of advertisements, and it is our special aim on such occasions to present a summary through our advertisement pages of the very latest and best which can be offered by those giving services or making products for the use of the Medical Profession



To encourage advertisers, our rates are not increased despite the much greater circulation of these issues, and to those who are not at present members of the British Medical Association the price of the Journal remains at 1/3 per copy exactly as in the case of an ordinary number

Announcement by the British Medical Association.

IN GENERAL PRACTICE

General Surgery; Public Health Work; Tuberculosis; Pediatrics; Dermatology; Gynaecology; Oto Laryngology, etc., etc.

Send for the latest reports on the progress of Actinotherapy

AS a general tonic treatment, as a specific in rickets, and as a curative means in certain forms of tuberculosis, anæmia, etc—actinotherapy is regarded as a most valuable addition to the armoury of present day medicine by an ever-increasing number of the most highly qualified men Difficulty, however, is often experienced in obtaining up to date information of the latest developments in this field—facts and figures relating to recent successes in this country and elsewhere

It is not unnatural that the Hanovia Company, who have specialised exclusively in the manufacture of actinotherapy equipment for over 25 years, and have supplied over 167,000 Quartz Lamps for medical purposes in all parts of the world, should possess a most complete record of all such progress

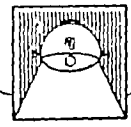
In the Hanovia Company you have a clearing house, an authoritative collection of all available facts ready to supply your needs, if you are interested in or practising actinotherapy

From whatever point of view you may be interested, Hanovia can supply you with the fullest information You place yourself under no obligation whatever by writing to the address below, stating what special branch of work is most likely to interest you

THE VARIOUS MODELS OF HANOVIA QUARTZ LAMPS

FOR ACTINOTHERAPY

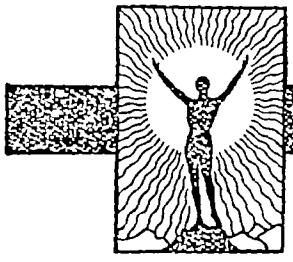
HANOVIA ALPINE SUN for general radiation Administered to individual patients lying or standing



THE KROMAYER LAMP for local or artificial treatment

JESIONEK QUARTZ LAMP for the treatment of groups of patients, in hospitals, clinics, etc.

THE PORTABLE HOMESUN LAMP for use in hospital wards or the patient's home, where roborant treatment is indicated
This lamp is intended only for tonic purposes



FOR LUMINOUS HEAT THERAPY

THE SOLLUX LAMPS for luminous heat therapy Also frequently used in conjunction with Hanovia Quartz Lamps

WRITE TO-DAY FOR DETAILS OF THE HANOVIA REPRINT SERVICE

Hanovia data is divided under the following heads —General Practice, General Surgery, Public Health Work, Tuberculosis, Pediatrics, Dermatology, Gynæcology, Oto Laryngology, etc, etc Over one hundred reprints of these and other subjects are available for free distribution to the Medical Profession A full list of these will be sent to you together with copies under any heading of special interest to you Write for this list to day Mark the enquiry Dept 9

Intestinal Atony

For establishing a natural daily evacuation of the bowels Cristolax offers a desirable form of treatment in every respect. It is not habit-forming and obviates the need of purgatives which often produce harmful results

Under the use of "Cristolax" tone is given to the digestive process inspissation of the faeces prevented and a healthy condition of the bowel maintained Further no leakage of oil occurs from the rectum as usually happens when liquid or semi liquid forms of paraffin are used.

Briefly described "Cristolax" is a digestant, lubricant, and bowel eliminant. It is in the form of fine granular crystals presenting an attractive appearance The taste is so very palatable that the product has been described as being as nice as sugar-candy"

"MODIFIED MILK IN INFANT FEEDING"

The above-named booklet of 64 pages will be gladly sent to members of the Medical Profession

The booklet shows how

Mellin's Food

is very readily adaptable to the needs of both the normal infant as well as the infant requiring a special modification of diet It contains suggestions respecting milk modifications for use in cases of constipation marasmus diarrhoea, etc

It shows the analysis of the mixture suitable for infants of various ages the weight of the various food constituents and their calorific value

Write for a copy to-day

MELLIN'S FOOD Ltd., LONDON, S.E.15

Builds up in underweight conditions and provides a perfectly balanced, highly nutritive diet for growing children

TO the problem of the "underweight" child Horlick's Malted Milk provides a convenient solution

For many years it has been successfully used by the medical and nursing professions for fast-growing children, for invalids, for expectant and nursing mothers — in all cases where it is particularly important to sustain strength and replenish natural energy quickly

Excellent results obtained by adding Horlick's to the diet of growing children have been strikingly recorded in many thousands of letters written by parents and members of the medical profession

Made from fresh, full-cream cows' milk, selected wheat and malted barley, Horlick's Malted Milk constitutes a perfectly balanced food — containing fat, proteids, and soluble carbohydrates in correct nutritive ratio

The vitamins of its constituents are unimpaired by the Horlick process

Horlick's contains neither cane sugar nor unaltered starch, but presents in proper proportions a sufficiency of valuable malt sugars, for which children have a greater toleration Moreover, Horlick's is partially pre-digested during manufacture, thereby assuring perfect assimilation

In addition to its important body-building qualities, Horlick's has the advantage of being an extremely palatable beverage Most children like the natural flavour of malt and will drink Horlick's with pleasure And it is now obtainable also in a new Chocolate Flavoured form — identical in constituents with the original Horlick's, but with fine chocolate added

Horlick's Malted Milk (both forms) is obtainable everywhere in sealed glass bottles, at 2/-, 3/6, 8/6 and 15/- Also in tablets

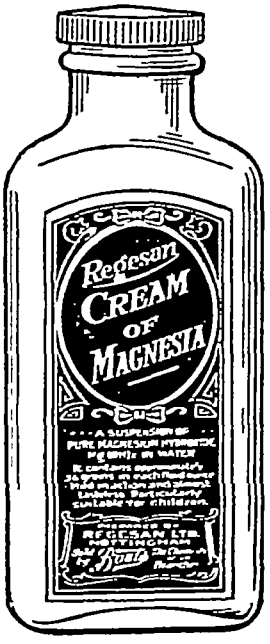
Further details and supplies for tests may be obtained from Horlick's Malted Milk Co , Ltd., Slough, Bucks

R AND C

Specially indicated in
NEPHRITIS - URÆMIA - ECLAMPSIA - ALBUMINURIA
and allied conditions.

PROMPT and proper diagnosis of kidney conditions is necessary in cases of Bright's disease and all types of renal disorders In nine cases out of ten the administration of a specific capable of producing real results in compensating for the loss of kidney function is also necessary

For more than a quarter of a century Nephritin has been a sheet anchor to physicians in treating such disorders Nephritin Tablets induce a marked increase in nitrogenous waste elimination They reactivate the cells of the kidney, increase urinary secretion, and induce a greater output of urea



Given in sufficient dosage these tablets produce marked results, and restoration to normal is quickly stimulated. They are invaluable also as a prophylactic in renal complications of infectious diseases and during pregnancy The tablets are composed of the hormones of the normal kidney as they appear in nature—*absolutely unaltered*

MEDULLA RUBRA

BONE-MARROW IN ANAEMIA FROM HAEMORRHAGE

W Borchardt (*Deut med Woch.* March 28th 1930 p 521) records the results of his experiments on young dogs in which anaemia had been artificially produced by the removal of about half their blood. In the first series some of the animals were fed with rib-marrow others with marrow from the long bones. Control animals received a corresponding amount either of liver extract The basal diet in each case contained a sufficiency of iron (5 mg per cent). Only the animals receiving the red rib-marrow showed a definite increase of weight, and their haemoglobin formation was more rapid than that of the others. In the next series the experiment was repeated but the iron content of the diet was reduced to 1 4 mg per cent. The result was similar but more striking the dogs receiving the rib-marrow regaining their haemoglobin far more quickly than the others.

THIS extract from the "Epitome of Literature" published in the 'BRITISH MEDICAL JOURNAL," dated May 3rd last, is important as representing in 1930 a complete justification of the formula upon which

Roboleine

THE FOOD THAT BUILDS THE BODY

has been produced without variation during the past twenty five years

The success of ROBOLEINE is thus due to intelligent anticipation and to consistently maintaining the highest possible standard of manufacture

Medical Practitioners are asked to satisfy themselves of the merits of ROBOLEINE, for which purpose testing samples will be gladly sent upon request.

In Genito-Urinary Antisepsis

Pyridium displays strong anti-bacterial properties toward coccal bacteria and B Coli It is of special service therefore in mixed infections, and, owing to its capacity for concentration in the tissues and organs of the genito-urinary system, its beneficial effects are noted, in addition to Cystitis and Pyelitis, in such conditions as Prostatitis, Epididymitis, Vaginitis, Urethritis, Endometritis, etc

TRADE **PYRIDIUM** MARK

(Phenyl-azo alpha alpha-diammo-pyridine hydrochloride)

Pyridium is administered orally in the form of 0 1 gram tablets—2 t i d — and in its early excretion through the urine, which it colours orange to red, it exercises a soothing and healing effect on the mucous membranes Pyridium has marked power of penetration which explains its success in counteracting the ravages of cocci and bacilli below the surface, and it also stimulates the proliferation of epithelial cells

Pyridium is the registered trade mark of the Pyridium Corporation of New York

Menley & James Ltd., P.O. Box 12a, Hatton Garden, London

'PANOPEPTON'

LEAN BEEF—the entire group of nitrogenous substances, those natively soluble and those rendered soluble by physiological hydrolysis, amino acids, and polypeptids, with the natural savoury extractives and minerals

ENTIRE WHEAT GRAIN—the peculiar complex of nitrogenous substances, those naturally soluble and those rendered soluble by physiological hydrolysis, amino acids, and polypeptids, the farinaceous substance converted into dextrin and maltose, and with the associated savoury constituents and minerals

Of the beef nothing is excluded but the indigestible connective tissue and lipoid Of the wheat nothing is excluded but the insoluble inert cellulose and silica of the shell of the grain

'Panopepton' is of a uniform standardized composition, it is highly concentrated, requires no preparation It is a potent restorative and emergency food in straits, a fortunate recourse for the invalid

Supplied in 12-oz bottles

In "Glycopenic" Disorders

Depletion of the glycogen reserves of the liver—a condition which may arise from a variety of causes—appears to be a significant factor in the etiology of a number of common ailments which may be classified roughly as cases of deranged carbohydrate metabolism

In this category are included the debility exhibited typically by the highly-strung child, cyclical vomiting certain forms of asthma migraine, night-terrors, insomnia and crises of collapse etc.

It is in these so-called glycopenic disorders that it has been found (*B.M.J.* Nov 15th 1930 p 810) that

"the administration of glucose acted like a charm"

In glucose therapy however purity of the carbohydrate is an essential consideration (*Lancet* August 2nd, 1930 p 236)

Medicinal Glucose B.D.H. is a pure chemical substance suitable for oral as well as for intravenous use its administration produces maximum therapeutic action free from every trace of harmful sequelae.

TWO LAXATIVE FOODS ··

★ *for changing the intestinal flora*

★★ *for supplying bulk & lubrication*

Lactose 73%, dextrin 25%—that is the proportion in which these carbohydrates are combined in this new food for changing the intestinal flora Both are more slowly absorbed than other carbohydrates, and both are able to reach the colon in sufficient quantity to cause a luxuriant growth of protective flora An acid reaction of the intestinal contents unfavourable to toxic organisms is thus produced —Lacto-Dextrin being highly efficient in promoting the growth and development of both B acidophilus and B bifidus in the colon In this pure carbohydrate food both lactose and dextrin are presented in a palatable and agreeable combination

Samples and literature of both these intestinal products will be sent to members of the Medical Profession on request to Coates & Cooper 41 Gt Tower St London E.C.3 Sole Distributing Agents for the United Kingdom and Irish Free State.

★★ PSYLLA

an accessory for use in conjunction with Lacto-Dextrin

Where bulk and lubrication of the intestinal tract is also required, the use of BATTLE CREEK Psyllia (Plantago Psyllium) is invaluable as an accessory The small brown seed when in contact with water swells into a soft gelatinous mass and acts most effectively both as an emollient and intestinal evacuant.

★ LACTO-DEXTRIN

Manufactured by the BATTLE CREEK FOOD CO., Mich., U.S.A.

Maternal Mortality

"It is disappointing to be unable to report any definite tendency towards reduction, especially as all investigation indicates that these figures might and should be substantially reduced"
—(B M J, 1930, 2, 792)

In these terms the Chief Medical Officer of the Ministry of Health in his annual report deplores the fact that in the year 1929 the death-rate from puerperal sepsis was the highest, with one exception, on record

"There is definite clinical evidence of the value of RADIOSTOLEUM in the treatment of puerperal septicaemia."—*(B M J, 1929, 1 984)*

Radiostoleum would appear, therefore, to be a particularly effective therapeutic and prophylactic agent for use in the attempt to decrease this incidence of puerperal sepsis, further—on account of its power to increase the resistance of the body—it is of considerable value also for arresting infective processes in general

MONSOL BRAND

PESSARIES

In response to repeated requests from the Medical Profession, Monsol is now available in the form of Pessaries containing 2½% of Monsol in a glyco-gelatine base Powerfully germicidal, non-irritant, and possessing all the essential characteristics of Monsol Fluid, they have proved of value in the treatment of both acute and chronic cervicitis and vaginal infections, particularly when of gonorrhoeal origin, and are specially indicated for a chronic infection in pregnancy when douching is undesirable

Monsol Liquid for dressings, douches, packs, and all sickroom purposes
Monsol Capsules keratin coated, for intestinal disinfection
Monsol Ointment and *Monsol Throat Pastilles*
Monsol Dental Cream
Monsol Medicated Soap

ABBEY HOUSE, LONDON, S W 1.

SYNTHETICS, OR THE STANDARDS OF EXPERIENCE —WHICH?

THE vogue of the Synthetic has penetrated everywhere —and into Medicine especially

Synthetics of the analgesic, soporific, and narcotic classes —when used with caution— have proved of real benefit. But possible secondary effects call for watchfulness on the part of the clinician

This is especially true of the Laxative Aperient, and Purgative classes of synthetics too often has irritation of the mucosa, excessive purgation, gastric and intestinal disturbance, and stasis due to a tired-out bowel, followed their use.

With elementary remedies, the clinician knows that secondary results do not follow But these same remedies have hitherto not been notably active enough

Experiments for increasing the activities of Magnesia and Pure Liquid Paraffin were carried out, with the result that the *form* of presentation was found to be the chief factor in increasing activity

In Magnesia-Oil (Musterole Brand) the ultra-superfine division of its components increase the softening and consequent evacuant power of these simple drugs, to a hitherto unattained degree!

Incidentally in M-O palatability and the absence of "leakage" and of all secondary effects are desirable characteristics

INDICATIONS

Constipation of All Ages and Pregnancy Hyperacidity Flatulence, Nausea, Hyperemesis Dyspepsia, Gastric and Duodenal Ulcers Simple and Ulcerative Colitis Alimentary Toxemias and Similar Conditions.

Local Anæsthesia in Surgical Practice

CLEFT PALATE.

Typical Case

E M, aged 25 years

Diagnosis Cleft palate

Operation Plastic repair

Anaesthesia Novocain-Adrenaline solution

Operation Nerves were blocked with a 2 per cent Novocain-Adrenaline solution, 30 c.c. in all being used In addition to the nerve block, an effort was made to separate the soft tissues from the bone by the "blowing-off process This was signally successful, the subsequent raising of the muco-periosteum being greatly facilitated by this preliminary manoeuvre The palate united completely with the exception of an opening the size of a lead-pencil at the mid-point This opening was later closed after making a local infiltration with Novocain-Adrenaline solution.

—Extract from Practical Local Anaesthesia (Farr)

(Full technique of this and one hundred other operations under Local Anaesthesia will be found in the above work, published by Henry Kimpton, 263 High Holborn, London, W C 1)

THE SAFEST LOCAL ANAESTHETIC.

Ample supplies of Novocain are available for the use of Surgeons at all the chief Hospitals Specify "Novocain" for your next operation

Does not contain Cocaine, and does not come under the Dangerous Drugs Act

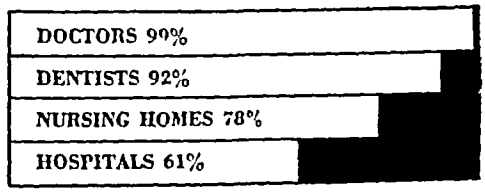
COW & GATE LTD. GUILDFORD, SURREY

Assimilation is easy— EFFORTLESS

When solid foods cannot be taken, these Essences quickly stimulate

DURING severe illnesses — pneumonia, gastric disorders, and extreme prostration — there is so often vital need for a food which can be rapidly assimilated without any strain on the digestive organs

In emergencies of this kind, doctors today find Brand's Essence indispensable A recent investigation revealed that as many as 99 *out of every* 100 interviewed recommended this product to their patients



For Brand's Essences contain all those invaluable constituents of meat which promote the flow of the gastric juices and make digestion easier

Consisting only of the pure essences of the finest fresh meats conserved in their natural form, they can be rapidly absorbed without the slightest strain on the digestion No substances are added which would prevent easy assimilation—such as colouring matter, gelatine, or preservatives

During that period in serious illness when a patient's vitality is at its lowest, these Essences never fail to restore energy quickly and easily And in convalescence, when the very idea of food is repugnant, Brand's Essences bring back the appetite — prepare the patient for more solid food

In common with other modern doctors, you need have no hesitation in recommending Brand's Essences to your patients They are obtainable at chemists and stores throughout the world in tins and glasses Samples will be sent you gladly on receipt of a professional card Write Dept F17 Brand & Co Ltd, Mayfair Works, Vauxhall, London, S W 8

Investigation shows that the following percentages of Doctors, Dentists, Nursing Homes and Hospitals interviewed recommend Brand's Essences

Through an exclusive process—known only to Brand's—the pure essence of the finest meats is conserved in its natural form

BRAND'S ESSENCES

Made only from the finest English Beef, Chicken or Mutton

"PANFLAVIN" TABLETS are issued in flat tins of 30 SAMPLES ON REQUEST.

COLLOIDAL ZINC HYDROXIDE

in the treatment of

ECZEMA, URTICARIA, PRURITUS

and similar diseases

Zinc lotions of the ordinary type have several important defects They leave a granular deposit on the skin after use and soil the clothing As the therapeutic action is a surface one only, the full value of the remedy is not obtained

COLLOZIN

This is a Colloidal Zinc Hydroxide, and is free from these manifest disadvantages It is a smooth, non-toxic, protective lotion, having mild astringent and antiseptic properties which assist tissue granulation By reason of its colloidal nature, its action is gentle, consistent, and prolonged, it gives an intimate and invisible distribution of the zinc hydroxide over the skin

Collozin is recommended as a protective application to the face against exposure to wind and sun, also after shaving It is effective in the treatment of tender feet

Issued in bottles 4 oz 1/6, 8 oz 2/6, and 16 oz 4/6

THE STRUCTURE OF THE EYE, FROM AN ARABIC MS —Vision had been explained by the ancient writers on Optics as the result of emanations from the brain, through the eye passing outwards (the 'sight spirit' of Galen) enveloping the object and returning to the crystalline lens Al Hazen combated this theory, and held that, on the contrary vision was produced by rays proceeding from the object to the eye, this external stimulus was converted into vision in the *humor crystallinus* which he placed in the centre of the eyeball The diagram here reproduced, from a fourteenth century Latin translation of Al Hazen's work, shows, when compared with those of his predecessors that the Arabian's knowledge of the anatomy of the eye was an improvement upon theirs

AVICENNA THE PERSO-ARABIAN PHILOSOPHER AND PHYSICIAN ONE OF THE EARLIEST TO PRACTICE PSYCHOTHERAPY

Avicenna's Canon of Medicine" which epitomises and codifies the knowledge of the science down to his day contains a section on cerebral diseases and their treatment. Under this heading we find an interesting direction for the cure of "love" by psychotherapeutic means Avicenna seizes upon the irregularities of the pulse as chief symptoms

And through this symptom" he proceeds it is possible—if the patient will not reveal it—to come at the identity of the beloved person. This knowledge will afford one means of treatment. The device by which it is gained is that many names should be repeated while the physician keeps his finger on the pulse and when it becomes very irregular and almost ceases he should repeat the process I have tried this method repeatedly and have discovered the name of the beloved. Then in like manner mention the streets houses arts crafts, families and countries associating with each the name of the beloved, and all the time noticing the pulse so that when it changes on the mention of any one thing several times you will infer from all this particulars about the beloved, as to name, appearance and occupation. We have ourselves tried this plan and have in this way reached knowledge that was valuable"

CALCIUM-SANDOZ

$(C_6H_{11}O_7)_2$ Ca

Unique Advantages:

1.—It is effective. It supplies the physiologically active calcium ion

2.—It shows distinct superiority in all modes of administration

ORALLY It is well absorbed It is easily administered and does not upset the digestive tract

INTRAVENOUSLY It is better tolerated than calcium chloride The acid-base factor is eliminated

INTRAMUSCULARLY It is painless and non-irritating It is the only calcium salt which can be so administered in adequate doses

3.—It enables physicians to adequately meet the requirements of any given case.

BY VEIN, for acute need
BY MUSCLE, to secure intense and prolonged action
BY MOUTH, for prolonged administration, to meet an increased demand by the organism

4.—It is completely sufficient in itself as a therapeutic agent.

CALCIUM-SANDOZ is supplied in

Ampoules containing a 10% sterile solution for intravenous or intramuscular injection
5 c c size Boxes of 2 and 10 ampoules
10 c c size Boxes of 1, 5, and 20 ampoules

Powder for oral administration—Cartons of 2, 4, and 16 ounces

Tablets for oral administration—Each tablet contains 25 grains of calcium gluconate and is especially adapted for division into three parts Boxes of 30 and 150 tablets Cartons containing 12 boxes of 30 tablets

An Address
ON
CARDIO VASCULAR SYPHILIS IN GENERAL PRACTICE*

BY

CARY F. COOMBS, M.D., F.R.C.P.,

PHYSICIAN AND IN CHARGE OF UNIVERSITY CENTRE OF CARDIAC RESEARCH, BRISTOL GENERAL HOSPITAL; PRESIDENT BATH AND BRISTOL BRANCH B.M.A.

THIRTY years ago—when I was a student—we were just beginning to realize the essential nature of the relation between syphilis and tabes: no syphilis, no tabes. And in my early out-patient days the art of skiagraphy which has added so much to our knowledge of these lesions, was only just beginning to be applied freely to the diagnosis of aneurysm. Again it was approximately at the same time, about 1907, that Schaudinn first published an account of the *Spirochæta pallida*. This gave a tremendous impetus to the study of syphilis. Within the next two or three years we acquired a new diagnostic weapon in the Wassermann test, and added salvarsan to our therapeutic resources.

It is not surprising therefore that our views as to the frequency of syphilitic injury to the heart should have changed in this period. Formerly thought to be a rare lesion it is now known to be one of the most inevitable results of the infection. This change is due partly to a more accurate understanding of the nature of cardio-vascular syphilis. In those early days we thought of it in terms of gummata; now we think of it in terms of aortitis. Recent experiences in the histology of cardiac syphilis have convinced me that in this change of view we have come nearer to the truth. In the course of a study of cardiac infections I have lately cut sections from a series of fifteen syphilitic hearts. Aortitis was seen in every case, while only once did I find a gumma, and that was a microscopical one.

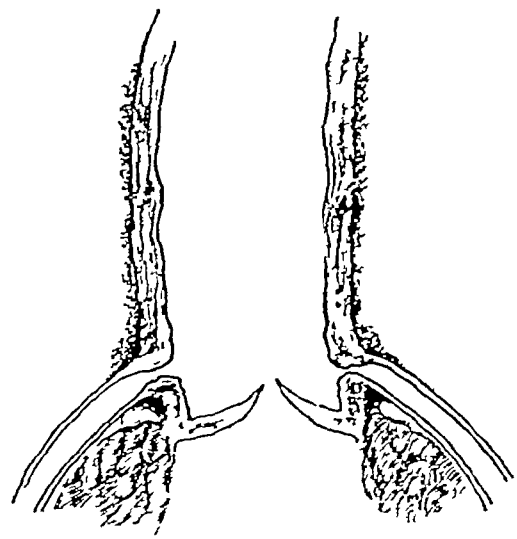

Diagram of the base of the aorta. The syphilitic process is shown surrounding the aorta and the coronary orifices and penetrating the media of the aorta and the bases of the aortic cusps.

PATHOLOGY

For more than one reason it seems clear that we ought to rank these lesions with those of tabes and general paralysis. They fall into the same epoch, a stage of the syphilitic process that is about twenty years after the primary infection. During that period in the vascular as in the nervous system there is no evidence of disease. When symptoms do appear they increase so rapidly as to suggest that lesions have been developing for years without any great disturbance of function, and this impression is confirmed by histological inquiry. Both aortitis and tabes then, develop in the same way and reach maturity at the same period. Moreover they occur in the same kind of person, in the middle-aged man, and in fact often coincide in the same patient, producing the Babinski syndrome more or less full-blown. Then again there are histological similarities: both sets of lesions appear to arise in the lymphatic system and to end in a kind of starvation of the special cells of the part concerned rather than in a direct poisoning of those cells themselves.

So far as the cardio-aortic pump is concerned the most constant lesion is aortitis. Sections of the aortic wall show that this inflammatory process spreads from without inwards (see diagram). Infiltrating the peri-aortic connective tissue masses of cells, mostly lymphocytes, fill the lymph channels and pile up in a dense layer lining the outer aspect of the aortic wall. Through this layer the vasa vasorum pass on their way into the aortic media, and at this point they are surrounded by the lymphocytes. The walls of these small vessels swell so much that their channels are almost closed. More striking still, however, is the investment of lymphocytes, which clings to them as they penetrate into the aortic media. The result is that in the media large collections of lymphocytes can be seen which spread *along planes between the laminæ of elastic tissue*. Later these laminæ break down and large spaces form within the aortic wall, which are filled with inflammatory cells. These spaces perpetrate wide-spread breaches of the medial elastic, and it is not astonishing that aneurysms are apt to form. At the corresponding part of the aortic wall the intima becomes thickened as if attempting to form a kind of buttress or emergency dam at the weak point in the wall.

Even if there were nothing else this breach in the *continuity of the medial elastic is a serious business*. It means that the circulation is deprived of part, at least, of that aortic recoil which constitutes one of the chief agencies forwarding blood to the periphery. The risk of aneurysm is, of course, not to be forgotten but this is occasional, whereas the loss of elasticity is invariable. It must involve an increase in the work which the left ventricle is called upon to do. Even if syphilis did nothing worse than this it would rank high as a cause of cardiac failure.

But it *does* much more. The inflammatory tide which we have described as breaking against the outer aspect of the aortic tube spreads along it towards the heart being checked at the root of the aorta owing to the disposition of the lymph channels. Yet the fact that it is, so to speak, held up here causes that inflammatory wave to spend itself with particular force on two structures that lie at this level—namely the arteries and the commissural mouths of the coronary attachments of the aortic semilunar cusps. The coronary orifices are nipped in a tightening grasp, the result being starvation of the muscle which they supply, with replacement fibrosis and degeneration of the myocardial fibres. Thus the ventricle is compelled to work harder, while starved of its proper nourishment. Further, the aortic cusps infiltrated at their commissural ends, become stiffened and adhere to one another and to the adjacent aorta thus becoming incompetent. Sometimes also they perforate near their bases. About two-thirds of the patients who suffer from cardiac syphilis display signs of aortic regurgitation. It is true that there are parts of the heart that are spared: the right heart is rarely attacked, the mitral valve never. Yet the syphilitic process achieves such a concerted attack on the cardiac functions as to set in motion a whole series of vicious circles and to bring about a failure, which moves with ever increasing velocity to the final catastrophe.

This is in general what we are to expect from the examination of a syphilitic heart. There are, of course, additions, as there are exceptions. The coronary vessels, or the aortic cusps or both may be spared. On the other hand gummata may be added to the changes which have been detailed. On the whole however we should think of cardio-aortic syphilis as conforming to the pattern which I have described and as coinciding in time and in other respects with the taboparalytic phase. Aortitis is in fact,

*Given on September 24th to the Bath and Bristol Branch of the British Medical Association.

a parasyphilitic lesion, and owes its existence to the survival in the body of spirochætes which have resisted treatment

Clinical Aspects

Now, since these lesions do not declare themselves by symptoms till approximately twenty years after the primary infection, it follows that we ought to be on the look out for a large number of cases during the forthcoming decade, for it was during and immediately after the war that the incidence of syphilitic infection greatly increased. It is true that during that period, and since, the treatment of syphilis has been more active and thorough than ever before. Nevertheless, the possibility of this increase in the incidence of cardio-vascular syphilis is partly responsible for the choice of my subject. A calculation based on an analysis of 2,089 cases of organic disease of the heart and blood vessels indicates that at the present time syphilis is the cause, in Bristol at all events, of about 5 per cent. of the cases. If autopsy data are taken, the incidence is even higher—about 8 per cent., according to Dr. Taylor's General Hospital figures. Already, then, it is not unimportant source of cardio-vascular disease.

Discussion of Signs

A majority of the patients whom I have seen have sought advice on account of cardiac symptoms. In a few instances some other effect of syphilitic infection, upon the nervous or other organs, has brought the patient under a general examination, and a cardiac lesion has been found. The usual course of events is a complaint of dyspnœa, or of precordial pain, or of both, by a man in middle life, who is found on examination to show signs of aortic regurgitation. Even in these straightforward cases there are several aspects that deserve some consideration.

The pain complained of is of the cardiac type, being substernal gripping in character, and aggravated by exertion. It is, however, often distributed over unusual areas, such as the front of the right shoulder, and it has a way of arising spontaneously, and without any provocative exertion, that is not so common a feature of the other pain-producing lesions of the heart. Then, again, one has to be ready to recognize aortic leakage on little evidence. It is true that the signs, once established, tend to increase steadily, and that the diagnosis is therefore soon declared. One small point to be remembered in this connexion is that it is worth while listening for the diastolic murmur with the patient in all sorts of positions. It may, for example, become audible when he sits up and leans forward. Dr. Hempath tells me that the use of a wooden stethoscope enables one to hear aortic murmurs that would otherwise escape detection.

Another point which I think receives too little attention is the extreme, and often decisive, value of blood pressure readings. This is particularly true of the incompetence that results from syphilis, which is so rapidly progressive that free leakage may be encountered even before there has been time for a corresponding increase of the ventricular mass. I need hardly add that the significant change is an increase in the pulse pressure. This is sometimes caused partly by increase of the systolic pressure, sometimes by a fall of the diastolic pressure, sometimes by both. More often it is a downward movement of the diastolic figure, which may fall so low as to be unmeasurable by the auscultatory method. In such cases one finds that as the air escapes from the armlet, the critical moment at which the loud arterial sound is replaced by a softer one is not reached at all, or is reached so gradually as to make a definition of its precise level impossible. When these phenomena are encountered, they are to be construed as evidence of a very free leakage.

In making a full diagnosis of cardio-aortic syphilis, as of any other visceral lesion, our object must be to visualize the anatomical and physiological disturbance as a whole. We must therefore compel ourselves to recollect that the disease which has thus injured the aortic valves has also, in all probability, inflicted damage on the wall of the aorta and narrowed the coronary arteries at their mouths. The damage to the aortic wall may be roughly assessed by dividing the cases into those in which there are no direct evidences of aortitis, those displaying signs of general aortic dilatation, and those with a saccular aneurysm.

In mentioning a group in which no signs whatever are found, I have in mind some in which even a careful x-ray examination failed to show any widening of the aorta. It is difficult to understand how this can occur, yet experience proves that it may. A considerable proportion of all cases is included in the second group. The physical signs are not very obvious as a rule. In many there is no more than an accentuation of the second sound, but this is highly significant in the appropriate context, especially in the presence of a normal or low blood pressure. To this may be added an increase in the aortic dullness, which may reveal itself on either side or on both sides of the manubrium. It is also worth while to percuss down the sternum. Ordinarily this should fail to encounter dullness, but if the aorta is enlarged the percussion note is decreased over the upper part of the sternum.

The physical signs of aneurysm are so numerous and so well known that there is no need to describe them here. Perhaps two comments may be worth while. The first is that one should differentiate as clearly as possible between saccular aneurysm and general dilatation of the aorta, since there is so wide a difference between the prognosis and the treatment of the two conditions. It is true that they are merely different stages of the same process, but the simple dilatation is important chiefly because of its implications in regard to circulatory inefficiency, while the aneurysmal sac behaves like a dangerous intrathoracic tumour. My other comment applies both to the aneurysm and to the general dilatation. Although examination with the *x*-ray screen is always helpful, we should practise the art of diagnosis by ordinary physical examination, since it is almost certain that in a majority of cases we shall have to make the first tentative diagnosis without depending on *x* rays.

It is even more certain that ordinary clinical examination must be relied on to furnish a basis on which to form an estimate of the amount of myocardial inadequacy in any given case of cardiac syphilis. Here one must be prepared to accept hints, and not to expect these to be too plain.

For example, a woman, aged 51, seen on the day on which these notes were written, gave a history of repeated miscarriage and of a fortnight's precordial pain arising independently of exertion, and spreading through the left arm to the finger tips. She was seen to be a little breathless on slight exertion, such as sitting up in bed for examination, and the lips were blush. Physical examination disclosed no explanation of the phenomena other than a myocardial one, and there was little but a reduplication of the first sound of the heart over the area of ventricular impulse, an ominous sign of myocardial impairment.

There is the more need for care in looking for such evidence, since the electrocardiographic method is not only difficult of access, but apt, in these cases at all events, to be equivocal in its results. Gross changes of rhythm are not very common in cardiac syphilis. Heart block was noted in three of my 103 cases, total arrhythmia in eight, and auricular flutter in two, with a possible third. The injury which syphilis does to the myocardium is a diffuse injury, since it is at the mouths of the coronaries, and there alone, that the blood supply of the cardiac muscle is cut down. Hence all parts of the cardiac wall suffer equally so far as this process of starvation is concerned, but as it is on the left ventricle that the brunt of the extra work caused by the aortic lesions falls, it is natural that the form of failure common in cardiac syphilis should be that which is described as ventricular. This is manifested by symptoms rather than signs. Yet there are two or three signs whose value can scarcely be exaggerated. First, there is weakening and diffusion of the impulse, and with it a corresponding weakness of the cardiac sounds. In these, again, a cantering rhythm or *bruit de galop* is often heard, and may indicate serious ventricular weakness. The sphygmomanometer may also supply valuable data. By its use we are able to detect alternations of the pulse too slight to be felt at the wrist or recorded on a pulse tracing. Then there is the highly significant shrinking of the pulse pressure gap which is so valuable an index of decreasing ventricular output.

This discussion of signs may now be summed up in a few words. To those which indicate aortic regurgitation we are to add, if we can find them, evidences of

aortic enlargement, and also of myocardial inefficiency When this has been done a mental picture of the extent and distribution of the lesion can be formed

The next question that we have to ask ourselves in any given case is What proof have we that this lesion is syphilitic? The answer is derived from four sources

1 There is the pattern of the disease itself Aortic incompetence in middle life precordial pain on slight exertion dilatation of the aorta—these are patterns which are likely to be syphilitic Other such as mitral stenosis with auricular fibrillation, are almost certainly not syphilitic

2 There is the patient's history I think we lose a good deal of valuable help because we neglect to make this inquiry relying instead on a Wassermann test

3 There is the collateral evidence furnished by signs of syphilis in other organs One or two examples will make this clear

A man admitted for aortic regurgitation was found to have a lump embedded in the right lobe of his liver This disappeared under treatment with potassium iodide In another instance a patient with a cerebral thrombosis and cardiac hypertrophy with high arterial tension showed a characteristic glossitis and again the use of potassium iodide strikingly accelerated his recovery A third case was that of a man with an aortic leak As we were on our way to the house I asked the doctor whether blood ought to be taken for a Wassermann test and he said that a glance at the patient's daughter would do more towards clinching the diagnosis In this man also I found an Argyll Robertson pupil

4 There is the Wassermann test There are one or two reasons why this comes last It is not absolutely infallible, sometimes it is impossible to get a specimen of blood and by relying on this test alone we may lose a good deal of valuable information which would otherwise be obtained

I wish I could add to these four criteria a fifth—namely, the response to treatment We all know how often this proves itself reliable in some forms of late syphilis

For example in the case of a man admitted to the hospital for pneumonia resolution was unaccountably delayed and at the same time precordial pain developed while he was lying at rest in bed This aroused suspicion a history of past syphilis was obtained and his blood reacted positively to the Wassermann test Fortunately the therapeutic test was also positive Under full doses of potassium iodide he improved steadily

Prognosis

Now it would be untrue to say that no benefit results from the treatment of aortic syphilis Signs and symptoms become less pronounced and may even disappear Yet the ultimate prognosis is nearly always disappointing In my own group of 103 cases I was able to trace the outcome, thanks to the help given by colleagues in 88 The results agree closely with the experiences of other We must say to ourselves whenever we establish a diagnosis of cardiac syphilis that its subject is not likely to live more than five years from the onset of symptoms

The risk of sudden death must also be admitted in every case of cardiac syphilis, but I do not think the patient should ever be told about it After all, sudden death does not occur in more than 10 or 20 per cent of all cases of this disease there are no distinctive signs by which we can pick out those that are likely to belong to this group and even if we could would this help us to prevent the catastrophe? For the sake of trying to seem clever it seems hardly worth while to add a burden of constant apprehension to the troubles of the patient

At the same time, it is evident that the outlook is more favourable for those people whose circumstances and temperament enable them to live quietly and avoid excesses especially habitual excesses of exertion and emotion This point has not only a prognostic but also a therapeutic bearing A mental picture of the state of the aortic wall is a powerful aid in correcting a too optimistic estimate of the amount of physical exertion which the cardio-syphilitic subject should be encouraged to undertake

We have to remember that in the decades at which the symptoms of cardiac syphilis begin to be felt the normal deterioration in arterial elasticity has begun It is very striking to see in the microscopy of these hearts a syphilitic lesion which injures the aorta grossly but spares the coronaries, with the exception of their orifices, aided and abetted by an atheromatous degeneration of the coronary trunks and branches High arterial tension is therefore to be feared, since it is apt to accelerate this arterial degeneration I am not, however, going to enter upon a discussion of the treatment of hypertension here but propose to limit my concluding remarks to a discussion of those measures which may be presumed to have some direct action on the syphilitic process

Treatment

1 The most efficacious is potassium iodide It is difficult to adduce evidence in support of this statement yet I am convinced of its truth, not only because this has been my own experience but also of others who have had opportunities of judging No one seems prepared to offer a satisfactory explanation of the action of potassium iodide on the later lesions of syphilis and the allied infections Yet I take it that there is no therapeutic fact of which we are more certain than that potassium iodide gets rid of gummata Now these lesions of the aorta and the cardiac wall are not gummatous Yet the action of potassium iodide in helping to diminish not only symptoms but also signs is I think not to be gainsaid The patient with cardiac syphilis should begin to take potassium iodide as soon as the diagnosis is made, and he should go on taking it for the rest of his life He will of course, have holidays from it but these holidays are to be prescribed for him and not by him One medical man whom I saw with this disease some years ago used to give himself iodine by inunction He thought it upset him less than the salt taken by the mouth It is easy to prove that iodine is freely absorbed through the skin by testing the urine for its presence within half an hour after inunction it can be identified there This method seems worth trying when the oral dosage is not well tolerated

2 Mercury I cannot claim to prove that mercury is more effective than organic arsenic, but it is certainly safer Each is useful by reason of its spirillicidal properties and one should, even at this eleventh hour of the syphilitic day, hunt down spirochaetes with undiminished zeal This is not to say that organic arsenic ought not to be given We give it to almost all cardio-syphilitics in hospital but ever since two of my patients died of exfoliative dermatitis and of gastro-enteritis respectively in both cases during courses of organic arsenic I have thought that these people must have been in some way unusually susceptible Others tell me that they consider organic arsenic may actually increase the cardiac lesion in some of these patients The plan which we follow now therefore is to prescribe the arsenic in relatively small doses at relatively long intervals for example 0·3 gram doses of novarsenobenzol are given at intervals of a week over long period till 5 grams in all have been taken Treatment by iodide and mercury is continuous and a course of organic arsenic is added from time to time

That we fail to do lasting good even by the most careful plan of treatment must, I think be generally admitted, after all this is no more than we should expect What hope is there of persuading ruptured elastic fibres to join up again or closed coronary mouths to open once more? The wonder is, not that treatment does so little, but that it does any good at all No more impressive argument in favour of early and thorough treatment of syphilis could possibly be brought forward than a series of microscopical sections of diseased aortas If there is any achievement of the syphilitic virus that signally deserves the title of "damaged good," it is surely to be found here

Conclusion

This brings me back to the original purpose of these remarks—namely to emphasize the fact that aortitis a distressing and fatal malady is the inevitable lot of the patient in whom syphilis is inadequately treated in the early stage There is good reason for hoping that the campaign against venereal disease which has given to everyone infected with syphilis an opportunity of early and thorough treatment, may succeed in its object and avert these disastrous sequels, but we cannot be confident of this, and it is therefore our duty to be ready for an increase in the incidence of cardio-vascular syphilis in general practice during the next decade or two

NORMAL STRUCTURE OF ENDOMETRIUM AND DECIDUA AND THE MENSTRUAL CYCLE*

BY

JOHN H TEACHER, M A , M D ,

PROFESSOR OF PATHOLOGY, UNIVERSITY OF GLASGOW

THE mucous membrane of the uterus differs from that of all other organs of the body in that it goes through regular cycles of change during a certain long period of its existence—namely, the reproductive period The menstrual cycle, ovulation, and pregnancy introduce complex normal variations in structure, and when to these are added pathological changes, interpretation becomes very difficult indeed For normal and pathological alike, a knowledge of the time relations to the cycle, the age of the patient, and the history of pregnancy and abortion is most important Conversely, the stage of the cycle to which curettings belong must often be guessed from our knowledge of the normal in cases where no history is available, or where the history is obscure from continuous or irregular bleeding

In the development of the endometrium into decidua there is increase in thickness, which is caused by congestion and oedema, swelling of certain of the stroma cells, and changes in the glands, which increase in size and become tortuous

The earliest change occurs in the glands About three days after fertilization the ovum reaches the uterus, and up to about the tenth day it lies free, being nourished by the secretion of the glands [1] It must then implant itself or perish Only after implantation has taken place do the decidua cells attain their characteristic form, while the glands, their work accomplished, undergo involution

The glands develop, with the prodigality of nature all through the endometrium and the epithelium, for lack of room to expand, forms papilliform ingrowths of such luxuriance that in longitudinal section each side of the gland may present an appearance which has been described as "saw-like" These glandular changes were formerly described as pathological, under the name "endometritis glandularis hyperplastica," although Gebhardt recognized their likeness to "pregnancy glands"

Since the work of Hitschmann and Adler,[1] published in 1908 it has been accepted that these changes represent normal development, which is called "pre-menstrual" "Endometritis glandularis" as an entity has disappeared, but the "pre-menstrual" gland still puzzles the pathologist, and can figure as papilloma or even adenocarcinoma

The menstrual cycle may be conveniently divided into four phases (1) Menstruation, or the breaking down or destructive phase Physiologically the appearance of the bleeding is regarded as marking the end of a cycle, but it is customary and convenient to date from it, as if it were the beginning (2) The post-menstrual phase or period of repair (3) The interval or period of rest during which there is little change in the structure of the membrane (4) The pre-menstrual phase, during which the changes develop We may assume that the proliferation corresponds to the early stage in the development of the endometrium into decidua It is customary to call all degrees of this up to very definite decidua "pre-menstrual," but I desire to be able to say that certain developments are due to ovulation or to ovulation and fertilization of the ovum, or that they *are* pathological To do this involves an attack on the generally accepted theory of menstruation and its relations to the ovary, but I have no compunction about attacking this theory, for I consider that its foundations are unsound in certain respects

The orthodox theory asserts that the menstrual cycle is dependent on the ovaries acting as an endocrine organ through the Graafian follicles and corpus luteum; that the internal secretion sensitizes the endometrium and causes proliferation, and that the proliferative changes are to be regarded as preparation for the reception of the fertilized ovum If the ovum is not fertilized, the menstrual breaking down occurs in due course, and the ripening of a new follicle initiates the period of repair, and ovulation and the development of the corpus luteum again bring about the pre-menstrual reaction If fertilization occurs, the corpus luteum governs the development of decidua and placenta It is clear on grounds of experimental comparative physiology that the corpus luteum is necessary for the establishment and for the continuance of at least the early stages of pregnancy

In the extreme form of the theory it is asserted that (1) there is no menstruation without ovulation—ovulation must therefore go on all the year round in the absence of pregnancy or disease, (2) that ovulation occurs about the middle of each cycle dating from the commencement of the bleeding, (3) that the ovaries work month about

Whether the ovum is fertilized or not the follicle proceeds to develop into a corpus luteum In the case of the normally menstruating female, therefore, it is said to be possible to take a pair of ovaries and count the corpora lutea, and by estimating their state of development or retrogression to arrange them in regular series covering four to six months This can be done, although we have never been able to do it properly But we are of the opinion that such seriation is capable of another explanation (see below)

The chronology of the corpus luteum for the orthodox theory of the cycle has been constructed by study of the ovaries in the living subject at operation and histologically in material obtained by operation and post mortem Gynaecologists differ strongly about the results of counting and dating corpora lutea in the living human subject, and we have found the histological method unconvincing We hold that there is only one method by which the ages of human corpora lutea and decidua can be determined—namely, from the history of properly dated young human ova

The corpus luteum found in the absence of pregnancy is commonly called the "corpus luteum of menstruation" or "corpus menstruationis" We hold that these terms express erroneous ideas, and therefore should not be used A corpus luteum signifies one thing—the ripening of an ovum, its relation to menstruation is problematical

The theory we accept was formulated by Heape more than thirty years ago in opposition to old theories of menstruation, from which the present orthodox theory is descended His main point was that ovulation and menstruation were independent functions in certain fundamental respects The observations were made on wild monkeys, and the work has recently been confirmed and made more precise by G W Corner,[2] Hartmann,[4] and others studying the colony of rhesus monkeys at the Carnegie Institute of Washington, Baltimore They find that in monkeys the occurrence of menstruation *is not dependent on ovulation*, but goes on more or less regularly all the year round, although ovulation, the absence of which is tested by the absence of corpora lutea, is in complete abeyance Moreover, in the absence of ovulation, the cyclical changes in the endometrium do not occur, and the bleeding may take place from an endometrium in the resting stage If ovulation occurs in a given cycle the resultant corpus luteum acts to bring about the so-called "pre-menstrual" changes in the endometrium Corner rejects the term "pre-menstrual" and substitutes "progestational"

Corner refers to cases in which his monkeys although menstruating regularly, showed only one corpus luteum between the two ovaries We have frequently seen this in the human subject, but usually the menstrual history was not obtainable or was uncertain We have, however, a very few cases in which a single young corpus luteum was present in patients who had been menstruating regularly, and Corner refers to similar cases The Teacher-Bryce Ovum No 2, the age of which is reckoned as 19 days, is the earliest specimen in which the whole uterus and ovaries are available for study, and there is only one recent and one very old corpus luteum It is clear that the subject was fertilized at the first ovulation after a period in which that function was in abeyance, but it is not *absolutely* certain that menstruation had been resumed after her previous pregnancy Properly dated this case

* Read in the Section of Bacteriology, Pathology, Physiology, and Biochemistry at the Annual Meeting of the British Medical Association, Winnipeg 1930

would have furnished most valuable information about the chronology of the corpus luteum as well as the endometrium in relation to the menstrual cycle, it is from this side that our strongest objections to the orthodox theory come

In 1908 Bryce and the writer[3] used the precise and trustworthy history of the Teacher-Bryce Ovum No 1 to correlate the data of twelve young ova in the history of which the date of the termination of pregnancy in relation to the menstrual cycle was known These data gave a series in which dimensions and ages gradually increased and supplied a mode of reckoning the age of very young ova which was so clear and consistent that it was accepted and adopted in Keibel and Mall's *Embryology* (1910)[6] A second table was then constructed to ascertain at which periods of the month fertilization and implantation would have occurred in the case of these ova on the basis of the first table The results were inconsistent with the old theories of menstruation and ovulation, but they agreed with the theory of Heape

The statement of the controversy made in 1908 is obsolete but the method of research was taken up by Grosser[7] in 1923 and the tables were reconstructed with much new material, the conclusions being revised in accordance with our present knowledge of menstruation, ovulation, and pregnancy The result is a chronology of the menstrual cycle founded on actual records of dates of coitus and termination of pregnancy which is inconsistent with the accepted theory

The second table shows that ovulation—with which cohabitation and fertilization must be regarded as practically synchronous—can take place at any period from the second to the twenty-fourth day of the cycle No period can be definitely indicated as the usual date of ovulation Fertilization, even as late as the twenty fourth day, prevents the menstrual breakdown while early fertilization produces the decidual reaction We conclude that the fate of the ovum governs the changes in the endometrium and the corpus luteum as well

The second theory, therefore, asserts that (1) The menstrual cycle in the human subject normally proceeds all the year round but ovulation and corpus luteum formation occur only from time to time (2) There is no regular date of ovulation The lunar rhythm of the cycle is therefore not due to ovulation and we are ignorant of its origin (3) In the absence of fertilization it is probable that several ovulations occur in succession, as in polyoestrous mammals like the mare or guinea-pig Possibly they occur at monthly intervals and from each ovary alternately, which would explain why the arrangement of corpora lutea in series can be made in a large proportion of suitable cases (Ruhl[8])

According to this theory the changes in the ovary and the uterus both depend on the fate of the ovum The most momentous occurrence in the life-history of the genital apparatus is the union of the male and female elements and it is reasonable to suppose that this event would communicate some stimulus to the maternal organism Normally it would be picked up by the mucous membrane of the Fallopian tube, and the immediate response of ovary and uterus would be growth of luteal tissue and endometrial glands

Menstruation is a cyclical process which provides for the maintenance of the endometrium in a suitable condition for producing the decidua of pregnancy but the ovum is not dependent on 'pre menstrual' reaction for a suitable nidus The uterus is capable of developing a decidua of conservation whenever it is called upon to receive and nourish a fertilized ovum

The occurrence of light proliferative changes in the endometrium near the end of a period would be interpreted as normal pre-menstrual reaction occurring apart from ovulation Hitschmann and Adler emphasized the invariability of the reaction Aschoff[9] refers to cases, possibly abnormal where it has not developed Probably there is always some reaction A more pronounced reaction at any period would suggest that ovulation and corpus luteum formation had occurred while early decidua would indicate fertilization also We have seen well-developed reaction long before its time on the orthodox view of the cycle, and we could find the ruptured follicle or early corpus luteum but we could not find the ovum Possibly the date of implantation had not been reached

Two other interesting possibilities are (1) failure to implant the ovum, or (2) the rejection of the ovum soon after implantation In such cases menstruation 'would occur from a membrane that could hardly be called anything but early decidua From a medico-legal point of view, however, it would not be justifiable to diagnose the occurrence of pregnancy from the finding of such a membrane Classical decidua or trophoblast must be found

To give an example of the practical bearing of this theory, some of our specimens have come from cases in which curetting was done on account of sterility and the surgeon demanded to know whether he had been so unlucky as to have interrupted an early pregnancy We did not care to assert this, but we hope we were justified in saying that such membranes showed that ovulation was occurring, or in some cases ovulation and fertilization as well Prognosis, therefore, was hopeful In these cases the theory of Heape appears to us more helpful than the orthodox theory

It is obvious that the two theories have much in common but there is sharp contradiction in the time relations For the discovery of the truth we want accurately dated young human ova These may be supplied by the new method of Allen and his collaborators,[10] who have washed free ova out of the tubes at operations, or by the older methods All depends on co-operation between the gynaecologist, the pathologist, and the embryologist so that the material may be found and properly handled

SODIUM AMYTAL AND OTHER DERIVATIVES OF BARBITURIC ACID *

BY

I G ZERFAS, M D,

ASSISTANT PROFESSOR OF MEDICINE, INDIANA UNIVERSITY MEDICAL SCHOOL

(From the Lilly Laboratories for Clinical Research, City Hospital Indianapolis)

APPROXIMATELY two years have elapsed since the first studies were made on the clinical use of sodium isoamylethyl barbituric acid (sodium amytal) In a preliminary report[1] certain clinical observations were recorded and attention was called to the need of further pharmacological and clinical work before definite conclusions could be drawn as to the safety, contraindications and limitation of this compound Since that time various experimental and clinical observations have been made by different investigators so that the status of this drug is now more clearly defined The purpose of this paper is to review briefly the data relating to sodium amytal and similar compound

CHARACTERISTICS COMMON TO DERIVATIVES OF BARBITURIC ACID

All derivatives of barbituric acid have certain characteristics in common which have long been recognized

1 They are primarily hypnotics only occasionally will amounts ordinarily producing hypnosis produce analgesia

* Read in opening a discussion in the Section of Anæsthetics at the Annual Meeting of the British Medical Association at Winnipeg 1930.

or anaesthesia Sufficiently large amounts will induce analgesia and anaesthesia in both animals and man, however, the dosage of such amounts precludes their routine use in man

2 There may be a marked variation in the effects observed with a given amount in the same or different animals Similar variations have been observed clinically, and are, perhaps, more accentuated when larger amounts are employed This variability of action has made it difficult to select the proper dosage

3 The amount required to produce a given therapeutic effect bears approximately the same relationship to the fatal dose in each of these various compounds in their clinical application

4 All members of the barbituric acid series may depress the respiratory and circulatory systems when amounts large enough to produce deep hypnosis are administered

5 Comparatively large amounts of any of the derivatives of barbituric acid may produce hallucinations, and so forth, when the amount excreted or destroyed reaches a certain level

Rate and Manner of Elimination

Apart from the characteristics enumerated above, applying in general to all derivatives of barbituric acid, there are certain differences which pertain very largely to the toxicity, and rate and manner of elimination or destruction

After the administration of moderate doses of diethyl-barbituric acid (barbital) to dogs, as much as 90 per cent of the amount administered has been recovered from the urine during the following seven or eight days[2] With large doses, however, the amount recovered falls to 45 or 50 per cent[3] That there was no retention in the latter instance was shown by the absence of all but traces of the drug in the tissues of the animal In most instances the daily excretion reached a maximum thirty-six to forty-eight hours after the administration[4]

The amount excreted varied somewhat with the mode of administration Fischer and Hoppe[5] found that 74 4 per cent was eliminated after rectal administration, 90 3 per cent after oral, and 92 per cent after subcutaneous administration Fifteen minutes after subcutaneous injection traces of barbital were found in the urine

The amount of phenylethyl-barbituric acid (luminal) recovered falls far below that of barbital Remert[6] reports the recovery of 22 per cent with the excretion persisting for ten days The maximum daily excretion occurred on the fourth day

Recently, Herwick[7] reported that in a series of six dogs given anaesthetic doses of iso-amyl-ethyl-barbituric acid (amytal) orally, and of four dogs that received comparable amounts intravenously, no amytal could be recovered from the urine during a period of five to six days When anaesthetic doses of *n*-butyl-ethyl-barbituric acid (neonal) were given, he was unable to recover neonal from the urine Hence the conclusion was drawn that these barbituric acids are probably broken down almost quantitatively in the body

Koppanyi and Lieberson,[8] from the observed persistent action of barbital and amytal in cats, calculated the average rate of elimination (or destruction) for twenty-four-hour periods Daily doses of 25 per cent of the average fatal dose were given intravenously At the end of five days two of the four cats receiving barbital died, indicating that the animals could not have eliminated (or destroyed) more than 25 per cent of the fatal dose in this period At the end of a week the cats receiving amytal were in the same physical condition as at the start indicating that they must have eliminated (or destroyed) nearly the entire daily dose Further experiments indicated that cats could eliminate (or destroy) an amount of amytal equivalent to from 40 to 50 per cent of the fatal dose in a period of twenty-four hours Animals consistently regain consciousness from a sub-lethal dose of amytal in one-half to three-fifths of the time required by them to recover from a similar dose of barbital

Early in 1929 Campbell and Shoule[9] devised a method which permitted them to recover quantitatively amytal added to the urine The twenty-four-hour specimens of several patients who had undergone operation under amytal anaesthesia were investigated In spite of the fact that large doses of sodium amytal had been administered intravenously, no trace could be detected in the urine Consequently, it was necessary to include the isolation of the possible decomposition products of amytal, which up to that time had not been prepared

When solutions of sodium amytal are allowed to stand, the barbituric acid ring breaks open with the elimination of CO_2, forming iso-amyl-ethyl-acetyl-urea This latter product further breaks down, forming iso amyl-ethyl-acetamide, NH_3, and CO. A few minutes' boiling is as destructive to a solution of sodium amytal as standing for some days at room temperature consequently, sodium amytal solutions cannot be sterilized by heating In addition to iso-amyl ethyl-acetyl-urea and iso amyl-ethyl-acetamide, iso-amyl-ethyl-malonamide was prepared, and the physical properties of all three were determined

Since amytal and the three decomposition products could be sublimed quantitatively without decomposition, they were able to use one general method Specimens of the urine, after acidification, were extracted with ether for twenty-four hours in Friedrich's apparatus[10] The ether extract was dried and concentrated to a small volume in the bottom half of a sublimation tube[11] and sublimed *in vacuo* The sublimate was dissolved in ether and re sublimed, the operation being repeated several times to assure better separation from the lipoid constituents which had been simultaneously extracted Amytal can be separated from its degradation products by its ready solubility in dilute NaOH

In spite of the repeated sublimation, there were usually a few milligrams of lipoid which persisted In each instance this non-crystalline sublimate was tested for the presence of traces of amytal, using, first, Millon's reagent, and secondly, injecting a dilute alkaline solution into mice

The investigators were unable to find amytal in the urine after the intravenous administration of as much as 22 grams of its sodium salt Extractions were made of aliquots of each twenty-four-hour specimen for a period of three to seven days following the operation Furthermore, they were unable to detect any of the three probable decomposition products, and they did not obtain any unknown constituents

Evidently, then, amytal is rapidly and completely destroyed in the body, no trace of it appearing even in the first twelve-hour specimen This is in contrast with the appearance of barbital in fifteen to thirty minutes after its intravenous administration in dogs

The absence of amytal in the urine following its intravenous administration is noteworthy That amytal is probably completely destroyed is indicated by the inability to detect any of the three possible disintegration products in the urine, no study has been made, however, of the faeces, of the content of amytal in the body tissues, or of the rate of disappearance from the blood stream

Pharmacological Action and General Effects of Sodium Amytal

Metabolism

Hines, Boyd, and Liese[11] have shown that amytal appears to lessen the ability of animals to utilize glucose when injected by the continuous intravenous method Hyperglycaemia and glycosuria, associated with a slight lowering of the plasma *p*H, occurred Hines, Liese, and Barker[12] found that approximately the same increase in muscle glycogen occurred in dogs with or without amytal anaesthesia The increase in liver glycogen was about twice as great in the unanaesthetized animals Hinsey and Davenport[13] also report that the glycogen content of unstimulated gastrocnemii of the rat and guinea pig did not decrease under amytal anaesthesia Much controversy has arisen as to whether the blood sugar level is increased under amytal anaesthesia, and opinions are *about* equally divided

Mulinos[14] states that amytal does not affect carbohydrate metabolism in the same chaotic manner as other, and that it allows the mobilizing mechanism of animals to respond to various experimental procedures Experiments, however cannot be said to have been performed on normal animals The glucose concentration in the blood of cats was not raised during the induction stage or for four or

five hours after anaesthesia was complete Moreover, it did not prevent the action of insulin on hyperglycaemia following sensory stimulation Certain clinical studies[13] indicate that sufficient amounts of sodium amytal to produce surgical anaesthesia in man did not increase the blood sugar levels above normal Brill[14] has shown that sodium amytal prevented hyperglycaemia seen following injections of morphine in dog

Bolliger and Maddox[17] state that sodium amytal, given intravenously to 125 dogs for the production of surgical anaesthesia produced a slight rise in the blood sugar levels, no change in the CO combining power, and a slight fall in the blood phosphates The blood urea of the dogs before they were given sodium amytal ranged between 135 and 340 mg per 10 c cm of blood In some instances the blood CO_2 was as low as 30 per cent It was found that less sodium amytal was required for those dogs whose blood urea was exceedingly high These experiments indicate that sodium amytal is not very toxic to the kidneys, even in the presence of uraemia

This is further borne out by the fact that there are only slight changes in the blood non protein nitrogen blood CO_2 combining power, and urine specimens obtained following the use of sufficient amounts of sodium amytal to produce surgical anaesthesia in man [15]

Emge and Hoffman[18] reported that patients who have received sodium amytal and morphine as a preliminary to inhalation anaesthesia take in more fluids in the twenty-four hours following the operation than patients receiving scopolamine and morphine At the same time the urinary output is actually and relatively decreased in the sodium amytal group

Patients receiving sodium amytal took fluid by the mouth more readily on the day of and the day following the operation, because of the greater freedom from nausea In the second twenty four hours the fluid intake in both the scopolamine and sodium amytal groups reached fairly equal levels but the ratio of output was lower in the sodium amytal group In the third twenty-four hours the fluid intake was slightly increased over the scopolamine group and the ratio of output to intake reached more similar levels They concluded from their studies of the glomerular activity of the two groups that there was no essential difference between them in the amount of phenol-sulphonephthalein excreted

The effect of amytal upon the basal metabolism of animals was studied by Deuel Chambers and Milhorat [19] They found it to be slightly lowered after amytal but it usually remained at a constant level despite a fall in body temperature of two to three degrees Lee [9] found that rats given 2 5 mg of amytal to each 100 grams of body weight showed a decrease in metabolism of less than 5 per cent that those given 5 mg showed an average decrease of 8 per cent and those given 7 5 mg an average decrease of 20 per cent It is doubtful in clinical cases if the basal metabolic rate is decreased much below that of normal sleep

Circulatory System

The effects of sodium amytal on the circulatory system are somewhat dependent on the amount rate and manner of administration of the drug It is possible by the rapid intravenous injection of sub-lethal doses of sodium amytal in animals to produce death or an immediate fall in blood pressure to alarming levels By the oral or intraperitoneal routes, the fall in blood pressure is less likely to be as great or as acute in its onset

Liebard Mulinos [1] state that sodium amytal when given intravenously to laboratory animals depressed the circulation and produced a prolonged temporary paralysis of the vagus to the heart which lasted from one to one and a half hour Shafer, Underwood and Gavron have confirmed these findings reported by Mulinos They also found the greatest slowing from stimulation of the vagus in decerebrate animals and the least in those just under amytal while intermediate slowing was observed in dogs under ether The blood pressure increased following stimulation of the vagus under amytal if the vagus carried a greater number of pressor impulses Lundy [2] and others have observed an increase in blood pressure in two cases following the intravenous administration of sodium amytal to surgical patients

As a rule, following the intravenous injection of sodium amytal in man at a comparatively slow rate (1 c cm per minute) a decrease in both the systolic and the diastolic blood pressure occurs, usually during the time the drug is being injected and becomes most marked when the patient loses consciousness Mason Baker and Pilcher [21] reported that the systolic pressure in all but a few instances fell to an average of 30 mm of mercury and the diastolic to an average of 15 mm during the induction of anaesthesia but returned to normal levels early in the operation Patients with hypertension those who are markedly sclerotic, and patients who are debilitated from chronic illness, may show much greater decreases in blood pressure —even to alarming levels

Forbes Wolff, and Cobb [23] observed that the vessels of the brain dilated under amytal anaesthesia following the intravenous injection of histamine and that the cerebro-spinal fluid pressure rose The vessels of the brain reacted to intravenous injection of histamine in a very different manner depending on whether the animals were under ether or amytal anaesthesia Emge and Hoffman [18] found that in nineteen patients who received sodium amytal by the mouth the systolic and diastolic blood pressure decreased in about the same proportion as that observed after the intravenous injection They state, further that this decrease has not given any trouble with haemastasis

Numerous observations have been reported on the effects of the drug on the pulse rate Mason Baker, and Pilcher [21] reported an average increase of fifteen beats per minute Emge and Hoffman [18] found an increase ranging from ten to twenty beats per minute In my experience the response of the pulse rate may be variable, though it is seldom slowed The increase in pulse rate is probably due to the effects of the drug on the vagus nerve

Respiratory System

Animals given fatal doses of sodium amytal died of respiratory failure which usually precedes that of the circulatory system, though failure of both sometimes occurs simultaneously particularly if the drug is injected rapidly

Page and Corvillo [24] have described certain irregularities in the rate of respiration occurring in animal under deep anaesthesia just before death The amounts necessary to produce this degree of anaesthesia in animals is much greater than that used for pre anaesthetic preparation of surgical patients or for other clinical uses

Isenberger [7] in a series of experiments on animals designed to show the effect of narcotizing agents on the function of respiration found that moderate doses of sodium amytal resulted in a slight decline in the rate of respiration accompanied by a compensatory increase in depth There was no change in the minute volume Repetition of this dose in the same animal produced a slight but definite fall in the minute volume of respiration due to a decline in the respiratory rate as the animal passed into a deep sleep The sensitivity of the respiratory centre to carbon dioxide after the second dose of sodium amytal remained practically unchanged from normal

Small doses of morphine given preliminary to sodium amytal seemed to render the action of sodium amytal more uniform as well as more intense and thus reduced the amount of both sodium amytal and morphine required He calls attention to the fact however that morphine may be chiefly responsible for the changes in the respiration observed after morphine and sodium amytal have been given in sequence in therapeutic doses also that basal narcosis as a result of the proper administration of sodium amytal in combination and sequence with morphine preceding the administration of a general anaesthetic (such as ether) and full surgical anaesthesia with relaxation were safely and easily established and adjusted At the same time there appeared to be retained a definitely higher degree of respiratory reserve than when either alone or preceded by morphine alone was used to a state of similar degree of anaesthesia and relaxation In the clinical use of morphine it is well known that patients are occasionally seen with marked impairment of

respiratory function following comparatively small doses, so that great caution should be exercised in the combined use of sodium amytal and morphine

Clinical observation of the administration of comparatively small amounts of sodium amytal for pre-anaesthetic preparation of patients has been described, and follows closely that defined for animals The respirations are usually regular in rate, but are frequently reduced in amplitude There was little change in the colour of the skin, although a slight degree of cyanosis has been noted Mason, Baker, and Pilcher[24] call attention to the development of a flush of the skin, sometimes resembling a febrile reaction

Central Nervous System

Sodium amytal and other commonly employed derivatives of barbituric acid are primarily hypnotics when used in amounts that are considered safe Occasionally one finds evidences of analgesia, and even anaesthesia, in patients who have received comparatively small amounts of the drug On the other hand, relatively large amounts may leave the patient in a hypersensitive state This indicates that either the state of the nervous system or the site of action of the drug may materially affect the results obtained

When the drug is injected intravenously the induction of sleep is rapid and quiet Drowsiness, noted by drooping of the eyelids, yawning, and slurring of words, comes on after the administration of 3 to 9 grains (0 2 to 0 6 gram) Mason, Baker, and Pilcher[24] observed that as the dose was increased the patient became reflexly hypersensitive, and finally entered a profound state of narcosis The pupils became contracted, and in some cases fixed, so that they would not react to light The corneal reflex was diminished, and the gag reflex remained intact The knee-jerks were often exaggerated during the period of hyperaesthesia In this state patients sometimes became restless, if stimulated, and some time was required before they again became quiet

The period of unconsciousness may last anywhere from three to six hours, depending on the amount of the drug given When a sufficient amount of the drug was eliminated or destroyed the patients passed through a mildly restless period of comparatively short duration, in which they were disoriented, moved aimlessly about, and uttered incoherent statements On regaining consciousness the patients may carry on a conversation but fail to remember anything about it when questioned later During the following hours they continued to be drowsy, and slept at intervals, but their co-operation was readily obtained for the administration of fluids, food, and so forth

When the drug is administered orally or rectally, essentially the same effects are obtained as by the intravenous method, except that a somewhat longer time is required

CLINICAL USE OF SODIUM AMYTAL

In our earlier work we used sodium amytal in approximately one hundred cases as the sole anaesthetic It was soon apparent that the marked depression upon the circulatory and respiratory systems carried with it certain dangers which would not warrant its general use The greater proportion of the patients were restless and delirious for a period of time, which added further to the difficulties of its employment as an anaesthetic agent Also there were no clean-cut criteria for judging the dosage when administered in such amounts

Subsequently, this drug and other barbituric acid derivatives have been employed in smaller doses to a definite advantage in the pre-anaesthetic preparation of the patient Holman and Palmer[28] state that the occasional restlessness and the mild delirium after operation are a definite disadvantage, but are usually absent when amytal is administered in smaller doses, ranging from 7 to 12 grains (0 47 to 0 8 gram) In their experience with the intravenous administration of the drug the drop in blood pressure is a distinct disadvantage Even with small doses this drop may be alarming, and may be sufficient to warrant postponement of the operation They think it may be an evidence of an individual idiosyncrasy to the drug, and its possible appearance makes frequent observations on the blood pressure during the administration of the drug imperative They conclude from their experience with its use in 150 general surgical cases that sodium amytal provides the normal induction of a natural sleep without the apprehensive struggling of a conscious patient The preparation of the patient could be performed before the administration of the inhalation anaesthetic There was a marked reduction in the amount of nitrous oxide required, and cyanosis was avoided The amount of oxygen added to nitrous oxide could be increased, varying between 16 and 32 per cent There was noted a marked reduction in the post-operative nausea, struggling, and pain Those patients who had experienced other operations under other anaesthesia claimed that sodium amytal rendered their present operation a pleasant experience in contrast to the ordeal through which they had previously passed In operations upon patients with exophthalmic goitre, and upon very apprehensive, excitable patients, sodium amytal has, they believe, a very definite place in anaesthesia, and may be used in doses of 7 to 12 grains (0 47 to 0 8 gram) with definite advantage to the patient

Mason and his associates,[24 29] using sodium amytal intravenously, called attention to the variation in individual susceptibility to the drug They found that the minimum dosage required barely to erase consciousness varied frequently from 3 to 9 grains (0 2 to 0 6 gram), illustrating the impracticability of estimating the proper dosage Factors of more importance seemed to be the age and general condition of the patient It was found that old or debilitated persons may fall asleep after 3 to 5 grains (0 2 to 0 3 gram) have been given, whilst young robust patients may require 7 to 9 grains (0 47 to 0 6 gram) before they lose consciousness

They used for the injection a very small hypodermic needle attached to a 10 c.cm. syringe During the intravenous injection of the first 3 to 9 grains (0 2 to 0 6 gram), in a room that is perfectly quiet, the patient slips away into a sleep that certainly, to all appearances, closely resembles the physiological state In only one instance was there any evidence of excitement during the induction of sleep by sodium amytal or during the induction of deeper anaesthesia by the superimposed inhalation anaesthetic They observed that the effect was reached immediately upon injection, and by observation of the patient's reaction as the drug was administered, he could with safety be carried to any of three stages desired—namely, co-operative stupor, deeper untruly stupor, or total unconsciousness They thought that the patient should not be allowed beyond the third stage, or the total loss of consciousness The experiences of many others also bear this out

From their experience with its use in 305 cases, they concluded that when the drug was used for the pre-anaesthetic preparation of the patient, with a dose just large enough to make the patient lose consciousness, it gave more satisfaction than any other drug used In patients with hyperthyroidism, and in those who were nervous, sensitive, or apprehensive, it gave the most satisfying results When the drug was given slowly and the administration stopped as soon as the patient lost consciousness, they considered that no serious or untoward effects would be experienced

Heyd[30] reports thirty-five surgical cases in which sodium amytal was used primarily as an adjunct to anaesthesia He suggests the following surgical indications for its use hyperthyroidism, and laparotomies in which it is desirable to have relaxation with ethylene, kidney operations, using sodium amytal supplemented by ethylene, to produce unconsciousness wherever there is an emotional element of any degree before any type of operation, for the control of post-operative delirium or excitement, and as a pre-operative measure to promote rest in highly toxic goitre cases

Lundy[31] reports the use of sodium amytal in 750 surgical patients, to whom the treatment was given by the mouth in doses of 6 grains (0 40 gram) to women, and 9 grains (0 60 gram) to men, one hour prior to operation He observed little, if any, delirium, nausea was rarely seen, and there was no difficulty with respiration

By the intravenous route he used it in large amounts, 457 times, to produce all or part of the anaesthe-

necessary to perform most of the various operations that are commonly done on man He called attention to the dangers of too rapid injection of the drug Following large doses he found that delirium, oedema of the lungs, pneumonia and the inability to raise mucus after thyroidectomy, developed and were definite reasons why the drug should not be employed as the sole anaesthetic

Link[2] reported 460 surgical cases in which sodium amytal was used for the pre anaesthetic preparation of the patient He used an average dose of 12½ grains (0·83 gram) intravenously He concluded that the drug should be given slowly and in amounts sufficient only to produce sleep The amount required was found to vary according to age, weight, and condition of the patient Patients with hyperthyroidism required larger amounts Post-operative nausea or vomiting was seldom seen

Cabot, Maddock, and Lamb[23] reported a series of 172 surgical cases in which sodium amytal was given intravenously in the pre-anaesthetic preparation of the patient, supplemented by inhalation anaesthetics They have given a complete resume of the effects of the drug on the respiration, pulse and blood pressure, with notations of the time required to recover from the effects of the drug Of particular interest were their observations regarding the percentage of lung complications In a series of ninety-three cases given ether, 15 per cent developed lung complications, in a group given ethylene, the percentage was 4, in their series of 172 cases, in which sodium amytal was employed, the percentage was 6·5 There were no deaths directly attributable to sodium amytal

Sise,[24] giving 9 to 15 grains (0·6 to 1 gram) intravenously for the induction of hypnosis preceding the use of intraspinal anaesthesia, found it of definite advantage in a limited number of patients who were hypersensitive and who demanded to be unconscious Brown,[25] Little,[26] Graham,[3] Ranson,[28] Aid,[29] Butt,[10] and others have reported on their experiences with the intravenous administration of comparatively small amounts for pre anaesthetic preparation of the patient

Drabkin Ravdin, Hirst, and Lapham[41] have reported on the use of sodium amytal by the rectal route in 33 obstetrical cases They used comparatively large amounts 25 to 30 mg per kilo of weight In ten cases the results were *good in seven fair, and in two they were poor* They found no effect on the rhythmic contractions of the guinea-pig uterus *in vitro* or *in vivo* The uterus responded to oxytoxic principle

When the drug is administered by the mouth or by the rectum about the same effects are observed as when the drug is given intravenously A somewhat longer period is required to obtain the same effect the drop in blood pressure is not acute as by the intravenous method and the duration of the effects are longer The drop in blood pressure, following its administration by the mouth or per rectum, and the period for recovery from such a decrease is apt to require a longer time

De Takats[4] states that the protracted oral medication of barbituric acid derivatives resulted in just as many different responses as with the other forms of administration

The uses of this drug, for purpose other than preanaesthetic preparation of the patient include the control of convulsions as observed in tetanus eclampsia strychnine poisoning status epilepticus, and cocaine and procaine poisoning It has also been used in controlling patients with delirium tremens, unmanageable mental cases and various post-operative psychoses The reduction of the amount of morphine required for cases of inoperable carcinoma is also very gratifying In one instance the amount of morphine used daily was reduced from 6 grains to 3/4 of a grain by the addition of 6 grains (0·4 gram) of sodium amytal given by the mouth at regulated intervals

Contraindications

In the field of anaesthesia patients who are poor anaesthetic risks may be considered poor risks when odium amytal is used for pre-anaesthetic preparation Patients with hypertension hypotension, generalized arteriosclerosis, elderly persons, and those who are weak and emaciated as a result of chronic illness are poor subjects for the use of sodium amytal If it is to be given to patients of this type, extreme caution should be exercised in the rate of its administration, and particularly in the amount given

Patients with pulmonary infections, lung abscesses, and bronchiectasis should not receive enough of the drug to interfere with the gag reflex, and it is better on the whole to use very small amounts, 3 to 6 grains (0·2 to 0·4 gram), preferably without producing a total loss of consciousness The drug should also be given cautiously, or not at all, following very large doses of morphine, or *in those patients particularly sensitive to morphine and* drugs of a similar nature Patients who are known to be hypersensitive to barbituric acid derivatives should not be given sodium amytal Weiss[42] and others have pointed out the danger of keeping patients unconscious for a prolonged period of time with derivatives of barbituric acid administered by any means

The intravenous administration of the drug should be stopped at once if an acute drop in blood pressure or a marked decrease in the amplitude of the respiration occurs

Discussion

Derivatives of barbituric acid have many characteristics in common but differ largely in toxicity and rate and manner of elimination Lundy[44] has recently made an exhaustive review of the literature on this subject The therapeutic margin of safety, based on experimental animal work has been determined for a great many of these compounds In clinical medicine we are interested to know the proportion of the fatal dose that will be required to produce a given effect For all practical purposes that relationship is about the same for all the commonly employed derivatives of barbituric acid Diethyl barbituric acid (barbital) is frequently cited as being the least toxic of the compounds mainly because the amount required to produce death in animals is relatively large Should one desire to produce a given effect short of the fatal dose the amount of barbital required would bear about the same relation to the fatal dose as that of a compound considered two or three times as toxic Should sub-equent sub-lethal amounts of barbituric acid be given before the entire amount was eliminated each time barbital would ultimately prove decidedly more toxic than those compounds eliminated or destroyed at a faster rate Fitch and his associates[12] state that there seems to be little advantage that can be claimed clinically for the intravenous use of one barbiturate over another, except in so far as the advantage lies in differences in the duration of depression and in the total quantity of the drug that the organism must destroy or eliminate

The clinical reports on the use of sodium amytal and other derivatives of barbituric acid indicate that they have a wide field of usefulness when given in comparatively small doses and for a definite reason

Essentially the same degree of hypnotic action is obtained when sodium amytal is given by the mouth or per rectum, as that observed when the drug is administered intravenously The respiratory and circulatory depression is less acute but the peak effect of the drug may not be obtained when desired and the rate of elimination or destruction is much slower

The intravenous method carries with it certain disadvantages, such as the dangers from too rapid administration more acute respiratory and circulatory depression and the technical difficulties and dangers inherent in intravenous administration of drugs However the effects are obtained almost immediately the minimum amount required for the individual patient may be judged more accurately, and the rate of elimination or destruction proceeds at a faster rate

On the whole I consider that for general use of this compound or other derivatives of barbituric acid it is safer to give it by the mouth or *per rectum, and that the* intravenous use should be reserved for emergencies where the effects are desired immediately or in instances where the oral or rectal administration is not feasible Likewise,

I consider that the intravenous method requires some experience and technical skill, and that the patients receiving such injections should be under close institutional supervision

As is well known, no fixed rule can be used for calculating the dosage, and individual variations exist in man This one point alone is sufficient to contraindicate the use of barbituric acid derivatives in large doses It is considered, however, that doses of 3 to 9 grains (0·2 to 0·6 gram), not exceeding 15 grains (1 gram), are comparatively safe limits for sodium amytal It is seldom necessary to use more than 7½ to 9 grains (0·5 to 0·6 gram)

In the field of anaesthesia there is ample evidence that sodium amytal is useful primarily as a hypnotic for the pre-anaesthetic preparation of the patient, and not as an anaesthetic agent In the field of medicine it is useful for the control of convulsions, unmanageable mental cases, and as a specific for strychnine poisoning

A COMPARISON OF SODIUM AMYTAL AND PERNOCTON AS PRE-ANAESTHETIC HYPNOTICS*

BY

E. I. McKESSON, M.D., AND K. C. McCARTHY, M.D.,

ANAESTHETISTS TO TOLEDO HOSPITAL, FLOWER HOSPITAL, AND LUCAS COUNTY HOSPITAL, OHIO

The properties and use of sodium amytal are becoming so familiar through the work of Zerfas, McCallum, Kast, Lundy, and others, that more than a brief recapitulation of its advantages and drawbacks is unnecessary This drug, when given intravenously in full doses, will, in many cases, produce complete anaesthesia without the use of any other agent, and, when the normal doses are not exceeded, is apparently without harmful effect When the drug has to be supplemented by other local or general anaesthetic agents a much smaller quantity than usual will produce satisfactory anaesthesia Higher doses cause a considerable fall in blood pressure, as much as 50 per cent in some cases, though the average is 25 per cent

Pernocton is the sodium salt of secondary beta bromallyl-barbituric acid Its pharmacological action and clinical effects resemble very closely those of sodium amytal, with several important exceptions

A number of cases in which hypnotic doses of sodium amytal were given were analysed Dosages varying from 5 to 12 grains and averaging 9 grains, caused an initial fall in systolic blood pressure, which ranged from 10 to 40 per cent , the average fall was 14 per cent Not one of our cases in which pernocton was given showed a fall in blood pressure As the doses were limited to produce only hypnosis all our pernocton cases were included in this series Falls in blood pressure of 5 per cent or less were disregarded as being within the range of error in making the determination

The hypnotic effect of pernocton seemed to be more powerful than that of sodium amytal, the average dose of which required to produce unconsciousness was 9 grains The average dose of pernocton used to produce the same effect was 4½ grains It would seem, therefore, that this drug has about twice the hypnotic action of sodium amytal

The recovery phase comprised three fairly definite intervals The complete unconsciousness following a hypnotic dose of pernocton closely resembled natural sleep, and varied in length up to seven hours with an average duration of two hours From this stage the patient gradually drifted into semiconsciousness, although nearly half were already in this condition, immediately upon leaving the operating table They could be roused to answer questions, or to take fluids, nourishment, and medicine, but would soon lapse into sleep again when left alone Perception of all external stimuli was dulled, and with the attainment of complete recovery there was usually no recollection of events that had taken place previously Restlessness during this period occurred only in 3 per cent of patients, and was easily controlled by small doses of morphine This affords a very marked contrast to patients who had received sodium amytal, half of whom showed more or less restlessness, and several required forcible restraint While it is true that the post-operative excitement seen during recovery from sodium amytal can usually be controlled satisfactorily by the prompt administration of morphine, it requires special nursing and constant vigilance during the whole recovery period

This period merged gradually into a third stage of recovery, in which the patient had full perception and was quite conscious, but felt somewhat drowsy and "dopey" The administration of morphine and other sedative drugs will modify and prolong these stages of returning consciousness In general, the recovery period was of half the length, and was characterized by much less restlessness than is associated with sodium amytal

Two patients in our series vomited considerably one immediately after the injection and one post operatively Though other factors might have been responsible it was felt that pernocton played some part in this post-anaesthetic sickness, and we attributed it to undue haste in making the intravenous injection These were among our first cases, since then we have had over one hundred additional cases, none of whom vomited or showed any tendency to nausea No vomiting followed the use of sodium amytal, and no respiratory depression or pulmonary oedema was seen

* A paper read in the Section of Anaesthesia at the Annual Meeting of the British Medical Association, Winnipeg 1930

Dosage and Administration

Pernocton is administered intravenously in 10 per cent solution It is put up in ampoules containing 2 2 c cm (3½ grains) of the solution, and is ready for injection without any dilution, mixing dissolving or other manipulation As the average hypnotic dose is only 4½ grains it can be seen that the volume of the usual injection will be about 3 c cm It is given at the rate of 1 c cm per minute and this smaller volume results in a saving of time and cuts short a rather tedious procedure

The pH of the solution is 9 8 as is that of sodium amytal, the injection must be given slowly to prevent concentration, and to allow dilution and absorption in the blood stream The dosage as recommended by Bumm averages 1 c cm for every 30 lb of weight, with a total average of 4 to 5 c cm , this dosage presumes that no other anaesthetic is being administered Since the majority of our patients received morphine in some form also we were able to obtain the same satisfactory results with smaller doses of pernocton

As in the case of sodium amytal many fractures could be painlessly reduced with the help of pernocton and other minor procedures be carried out without the aid of any other anaesthetic The use of pernocton in obstetrics will be reported upon subsequently, since we have not yet sufficient cases to draw definite conclusions in this respect

Summary and Conclusions

Pernocton (sodium secondary butyl beta bromallyl barbituric acid) is a synthetic barbiturate resembling sodium amytal in its composition and action It has all the advantages of sodium amytal as a hypnotic, and in addition there is (1) almost complete absence of restlessness and excitement during the recovery period (2) no fall in the blood pressure (3) a more powerful hypnotic effect, (4) a solution prepared ready for injection (5) a smaller volume to be injected (6) a shorter period of unconsciousness, and (7) better and earlier co-operation during the recovery phase

INTRAPERITONEAL GESTATION WITH RECTAL HAEMORRHAGE

BY

J TILCOCK M B LRCS,

LATE ASSISTANT MEDICAL OFFICER HACKNEY HOSPITAL.

Although extrauterine gestation is unfortunately not exceedingly uncommon accident cases are rare of such a conception persisting more than a few weeks Death of the ovum with its expulsion as a tubal mole or rupture with its attendant train of acute phenomena, usually terminates the pregnancy or possibly pain and maybe unexpected irregular vaginal loss arouse the patient's suspicions that all is not proceeding as it should For women are learning to-day that the normal pregnancy should follow certain definite lines and that any gross departure therefrom should call for a medical examination

An ectopic gestation persisting for any length of time is bound to cause considerable disturbance in that portion of the abdomen or pelvis within which it is situated How disastrous these disturbances may be is illustrated by the following case

A multipara aged 27 who had had three previous normal pregnancies was admitted to Hackney Hospital on January 26th 1928 stating that she was six months pregnant was suffering from severe pain in the lower abdomen and had that day commenced bleeding per vaginam Her last regular monthly period had been six months previously and though she was certain that she was pregnant her pregnancy had by no means followed a normal course On careful questioning it transpired that her amenorrhoea had not been complete She had had several small attacks of bleeding and a more or less continuous yellowish vaginal discharge All the time she had suffered from malaise and from an almost constant lower abdominal pain and backache This pain had had several exacerbations which necessitated her lying up from time to time but until three days before admission she had not had any really acute attack of pain Her acute history dated from January 23rd when she was seized with a violent pain in the left iliac fossa and felt very ill she was admitted to hospital three days later with a temperature of 101.2° F a pulse rate of 140 and passing clots per vaginam

On examination she looked ill and was very pale The breasts were active All the lower part of the abdomen was held rigidly and was very tender on palpation especially in the left iliac fossa Rising from the pelvis was a tumour reaching almost to the umbilicus and extending over towards the left side of the abdomen It was non fluctuant and dull to percussion A souffle was audible about one and a half inches below the umbilicus but not over the position of the uterine arteries On admission the uterus was not felt apart from the tumour but when the muscles were relaxed under anaesthesia this physical sign as will be seen later proved to have been erroneous The tumour was not felt to contract under the examining hand Foetal heart sounds were not heard nor were movements detected On vaginal examination clots of blood and a vaginal discharge were found to be present there was tenderness in the anterior fornix and the os uteri admitted a finger tip Bimanually movements were not transmitted from the swelling to the cervix

The following day an anaesthetic was administered primarily with a view to a more thorough examination As the patient was being placed in the lithotomy position before the vaginal examination she passed 20 oz. or more of bright blood per rectum A rectal examination revealed nothing to account for this With the abdominal muscles well relaxed the uterus was now felt as a separate entity lying well to the right side and enlarged to about twice its normal size A uterine sound confirmed this In view of the copious rectal haemorrhage an immediate laparotomy was performed

Adherent to the abdominal wall below the level of the umbilicus and above the left broad ligament was a sac which when opened proved to contain a very offensive fluid mass of faeces blood and liquor amnii together with a partially macerated foetus the whole showing evident signs of infection The foetus measured 17 cm from vertex to buttocks and was well formed The placenta was seen in the left lower aspect of the sac Severe haemorrhage from large vessels which lay around the placental site and in the wall of the sac negatived any intervention beyond rapid removal of the foetus marsupialization of the sac and firm packing A blood transfusion of 400 c.cm was given that evening There was little further bleeding from the very offensive wound in the abdomen but there was extensive bleeding per rectum and the patient died on the following evening

A post mortem examination was performed Most of the lower abdomen was found to be occupied with a sac situated in the abdominal cavity above the left broad ligament formed by omentum transverse and descending colon caecum and the anterior abdominal wall The placenta was adherent to the abdominal wall in the region of the left iliac fossa and to the descending colon It measured about three inches in diameter The left tube and ovary could not be identified A perforation which admitted a finger connected the sac with the descending colon and the whole colon and caecum were distended with blood No other perforation existed In spite of the fact that at the operation the general abdominal cavity was opened there was no evidence of peritonitis in the upper abdomen

Certain features in this case appear to call for special comment Communication of the sac of an ectopic gestation with the bowel, particularly the rectum has been recorded previously The remarkable fact seems to be not that such perforation did occur, but that the sac being situated in the position in which it was this rupture did not occur earlier Cairns Forsyth[1] and Schwartz[2] record cases of perforation of an ectopic gestation into the rectum, and in both cases the age of the foetus was about six weeks It is also interesting to note that in both these cases the symptom which most imperatively called for surgical intervention was rectal haemorrhage Schwartz in the description of his case, in fact, remarks "Dans tous les cas, c'est l'existence d'une abondante et subite haemorrhage rectale qui a commandé l'intervention"

Needless to say, except for the close proximity of the rectum and descending colon on the one side, and the caecum on the other, there is no reason why the bowel should be involved more than any other viscus The

bladder has been eroded in more than one case, and Gayet[3] describes a case in which, after two years, a four months foetus was voided piecemeal per urethram, having during that time remained incarcerated in a sac adherent to the bladder, eventually forming a false diverticulum

That there was no definite attack of acute pain during the patient's pregnancy to suggest that at that particular time tubal extrusion had occurred is another curious point The oosperm must have been expelled at a very early date without any very acute symptoms to point to the event, for her pregnancy presented a fairly continuous and uniform story of general malaise and pain persisting until the final very severe attack which resulted in her admission to hospital

Whether a primary abdominal pregnancy ever occurs is very doubtful It is safer and less controversial to assume that a tubal gestation was extruded into the abdomen, the actual moment of extrusion having been missed in the general abdominal pain and discomfort attending the abnormal pregnancy

Again, with the sac containing the foetus situated as it was so close to the bacteria-laden descending colon, it seems rather surprising that infection should have supervened at such a relatively late period For, by comparison of the period of comparative amenorrhoea by which the patient dated her pregnancy with the development of the foetus, the latter must have been lying dead in the sac for a full month That infection does occur and produce serious developments in these cases is shown by a case recorded by Skinner[4] in which the placenta was attached to the liver, and infection of the sac, presumably from the adjacent bowel, ensued with a foetus of the twenty-fifth week It is a great testimony to the resistance of the peritoneum that this infected cesspool, for it was little else, could have remained so localized in the lower abdomen with no inflammation in the remainder of the abdominal cavity

There remains the fact of the massive dilatation of the whole of the large bowel with blood, as discovered at the post-mortem examination, although there was no perforation or haemorrhage discovered into the colon at any point proximal to that described One can only suppose that in the generally collapsed state of the patient shortly before death, continued haemorrhage passively distended the colon, which simply acted as a reservoir, being unable actively to expel its contents owing to the atony preceding dissolution

In conclusion, I should like to express my thanks to Dr W Brander, late medical superintendent of Hackney Hospital, for permission to publish this case

A FAMILY TENDENCY TO TALLNESS OF STATURE, OBESITY, AND DIABETES.

BY

R SYDNEY ALLISON, M D , M R C P ,

ASSISTANT PHYSICIAN, RUTHIN CASTLE

The family described consisted of a father, mother, daughter, and two sons, the father being a well-proportioned man over six feet in height The mother, aged 44, had had glycosuria since she was 21 years of age It was mild in character, associated with obesity, and was readily controlled by dieting A sugar tolerance test gave a diabetic curve The children showed a disorder of growth and nutrition On inquiry, many of the relatives of both parents were found to be similarly affected The following diagram indicates the occurrence of obesity (O), diabetes (D) and tall stature (T), among the members of both families, paternal and maternal

An opportunity occurred of examining the three children of the present generation, and a short account of each is given

The Daughter

History—Aged 21 Rapid growth in early teens Easily tired and subject to headaches Shy and nervous disposition Menstruation began late, at the age of 17-18, the discharge has always been scanty in amount, scarcely lasting more than an hour, and accompanied by severe pain

Examination—Height 5 ft 10 in , weight 11 st 2 lb (in clothes average weight would be about 10 st 8 lb) Fat not excessive and evenly distributed Tall stature, with broad chest and pelvis Hands and feet in proportion Hair distribution normal but under developed for her age Blood pressure 125/70 mm Hg pulse 88 temperature 98° F Visual fields optic discs, and pituitary fossa normal Urine sugar free A sugar tolerance test (60 grams of cane sugar on a fasting stomach) gave a normal result Fasting, 0 09, 30 minutes, 0 15 1 hour, 0 09, 1 hour 30 minutes, 0 09, 2 hours 0 06, 2 hours 30 minutes, 0 05, 3 hours, 0 07

The Elder Son

History—Aged 18 Tendency to put on flesh was first noticed at the age of 10 In the last year, in spite of dieting, he has gained 2½ stone He is inclined to fall asleep during the day, and has difficulty in wakening in the morning Temperament irritable

Examination—Height 5 ft 10 in , weight 17 st (in clothes, average weight would be 10 st 8 lb) His appearance resembles that of a man of 30 years of age He has copious hair, with male type of distribution Average genital development mature sexual desire Gross obesity, the fat being distributed mainly round the hips and shoulders and on the breasts Blood pressure 138/70 mm Hg, pulse 64, temperature 97° F Visual fields and discs normal An *x* ray examination of the skull revealed a normal pituitary fossa and normal epiphyseal closing in the long bones Urine sugar free Sugar tolerance slightly increased Fasting, 0 09, 30 minutes, 0 14, 1 hour, 0 08, 1 hour 30 minutes, 0 09, 2 hours, 0 09, 2 hours 30 minutes, 0 09, 3 hours, 0 08

The Younger Son

History—Aged 15 Is said to have weighed 14 lb at birth Noticeable gain in weight at 6 years of age Frequent headaches, but no somnolence He is of a placid, gentle disposition

Examination—Height 5 ft 11¾ in , weight 16 st. 2½ lb (in clothes, average weight would be about 11 stone) The skin on the trunk and limbs is hairless and smooth On the pubes the hair distribution is feminine in type The genitals are below the average for his age Gross obesity, with a distribution similar to the elder brother Blood pressure 130/70 mm Hg pulse 88, temperature 98° F Visual fields, discs, and *x* ray film of skull normal Normal epiphyseal closing Urine sugar free Slight increase of sugar tolerance Fasting 0 09, 30 minutes, 0 13, 1 hour, 0 10, 1 hour 30 minutes 0 11, 2 hours, 0 09, 2 hours 30 minutes, 0 09, 3 hours, 0 07

REMARKS

The association of obesity, genital hypoplasia, and lack of growth with a pituitary tumour was first noted by Fröhlich[1], later, the relation of these symptoms to the anterior lobe of the gland was confirmed by the experiments of Paulesco,[2] Cushing[3] and others It was also recognized that such symptoms could be produced by a simple disturbance of function alone without a tumour being present Dott[4] found that the removal of at least two-thirds of the anterior lobe was necessary to produce effects in animals No results followed excision of the posterior lobe, though subsequent increase of carbohydrate tolerance was observed by Cushing In a recent clinical review Engelbach[5] states that increased functional activity of the anterior lobe, before puberty, leads to tall stature and gigantism, and to acromegaly in adult life The

reverse action produces infantilism genital hypoplasia, amenorrhoea and sterility Overactivity of the *posterior* lobe may cause decreased sugar tolerance and glycosuria, and underactivity increased tolerance and obesity

These principles may be broadly applied to the three children examined The daughter grew rapidly at first, but the onset of menstruation was delayed and the monthly loss is now scanty The inference in her case is that there was increased activity of the anterior lobe at first, followed later by underactivity The absence of obesity, glycosuria and a normal sugar tolerance suggests that the posterior lobe is functioning normally In the two sons the main feature is the extreme obesity which is distributed in the pituitary fashion, mainly girdle-wise Sugar tolerance is only slightly increased The skeletal and sex development differ, but both are abnormal in these respects It appears probable therefore that there is a bilobar dysfunction in their cases Except for headache, there were no symptoms of increased intracranial pressure or tumour In all three the symptoms were such as might be expected from a single disorder of function alone Similar cases have been described in a paper by Langmead and Calvert[4] and in another by Gardiner-Hill Jones and Forest-Smith[7] The latter authors noted that the obesity had existed since birth in about one-third of their cases, and that it had often followed an acute infectious fever in the remainder

The family as a whole is of interest in showing a tendency to endocrine disorder Rahilfs[8] has reported a case of three brothers two of whom were obese and under-developed The tendency appeared to have been transmitted from the mother's side Troisier and Monnerot-Dumaine[9] described a family in which obesity had affected the females of three generations In the instance described here there is tallness and obesity on the paternal side, and diabetes and obesity on the maternal Though such tendencies are usually corrected by intermarriage, the union of the two families in the present case has apparently intensified some of the features which they had in common, as is seen in the three abnormal children Their appearance suggests a disturbance of pituitary function and it may well be that the less defined complaints of their forebears were caused by a similar underlying pituitary disorder

Grateful acknowledgements are due to Dr G Bark of Wallasey by whom the cases were referred for investigation and to Mr A. J Leigh who made the estimations of blood sugar

ULTRA-VIOLET LIGHT IN THE TREATMENT OF THE DULL AND BACKWARD CHILD

BY

FRANK SUGDEN M.B. CH.B.,

MEDICAL OFFICER, THE RED HOUSE FARM SCHOOL, BUXTON, NORFOLK

WHEN I first used ultra-violet irradiation for the various physical disabilities of children I was struck with the marked improvement in the mentality in many of the cases treated I am sure that it must be quite a common experience for the actinotherapist to note the change in the clinical picture The puling querulous irritable anaemic self-centred sleepless child who is often pot-bellied and emaciated is transformed into a robust well nourished and perfectly healthy little animal full of life and gaiety all this happens within a few weeks

The following observations were made at one of the Home Office schools which makes a specialty of training and educating dull and backward boys and borderline cases of mental deficiency The school stands on an elevation in Norfolk and is a perfect "sun trap" Due to the hygienic conditions under which the boys live, and the active sympathy and co-operation of the head master and his staff, the results are remarkably successful in regard to both physical and mental development The same standard of improvement could not be expected to obtain in every case, but with the exception of those boys who turn out to be definitely mentally deficient, it is very exceptional to find one who has not shown signs of both physical and mental development

Such a case was brought to my notice a few months ago by the head master who suggested that the boy might accompany a batch of boys who were coming to me for light treatment on account of their skin conditions I append the reports of the school staff at the date of the boy's admission to the school and immediately before the treatment was commenced, the details and dates of the treatment and an extract from the report on the boy's present condition from the same source

On Admission—A B in February 1922 was a miserable sickly child nervous and ready to whine when addressed lifeless and with little interest in games or anything in particular His work in the schoolroom was poor and his power to concentrate was weak He made a certain amount of progress but much less than that of a normal boy

Before Actinotherapy—The only time he showed interest in anything was when he was in the swimming bath he could swim and dive fairly well An interview of any kind was a terrible ordeal for this lad "Yes sir" and "No sir" was about all one could extract from him

Treatment—The mercury vapour lamp used for the treatment of this patient was that designed by Dr Percy Hall General exposures were given both front and back at a distance of 30 inches The durations of the exposures were as follows March 21st 3½ minutes March 25th 5 minutes March 28th and April 1st 7½ minutes while ten minute exposures were given on April 4th 8th 11th 15th 17th 22nd, 25th and 29th

Subsequent Report—A B seems to have begun really to live and enjoy life like a normal boy and he is making much more rapid progress educationally he concentrates better on all his work and especially woodwork. He now takes an interest in games swims and dives with real energy and has added a backward somersault to his attainments in the swimming bath He is certainly much more cheerful going on home leave among his friends never had this effect We are now seriously considering entering samples of his woodwork into an open competition In July 1929 his weight was 68½ lb and his height 4 ft 8 in In October his weight was 69 lb in December 70½ lb., in March 1930 70 lb in June 73½ lb and on August 12th 74¼ lb He has gained one inch in height

If this was the only case so benefited I should not have ventured to plead for further trial by other workers in this field I have had other results equally successful but not so typical and therefore not so sufficiently illustrative of the point I wish to make

From some years of experience I know that splendid results may be achieved simply in the lower class dull and backward child by change of environment plenty of wholesome nourishing food which is temptingly prepared fresh air sunlight (including sun-bathing), and hygienic accommodation When to these is added the assistance of a school staff specially trained to the work, very satisfactory result ensue almost without exception, but, as in the case here reported some little extra treatment may be required to put the exceptional child in the way of becoming a useful citizen In cases of unsatisfactory progress the mercury vapour lamp may prove to be of remarkable value in the therapeutic armamentarium

I make no claim to having had a large experience of this class of case but the results are so satisfying that I cannot urge too strongly that those who have to deal with this type of child institutionally should at any rate give the treatment a fair trial Further it is quite reasonable to assume that even the mentally retarded children of the better classes would benefit by this treatment in the same way as do others At the moment there is no definite line of demarcation between the dull and backward and the mentally deficient type Bearing in mind the present case it is reasonable to assume that patients may be occasionally selected and their standard of mentality be considerably raised by actinotherapy

MEDICAL, SURGICAL, OBSTETRICAL.

NOCTURNAL INCONTINENCE IN CHILDREN

The treatment of nocturnal incontinence in children is eminently unsatisfactory The distress of mind caused to parent and also to child as soon is it is old enough to realize its disability calls for the publication of any method of relief which has proved successful in several cases

The time-honoured method of getting the child to empty its bladder on going to bed and of awakening it in an hour or two to pass water, of withholding all drinks after 5 or 6 p m, and of fixing reels to the child's back to prevent it lying supine, have in my hands proved unsuccessful I have administered tincture of belladonna up to 30 minims three times a day on the advice of textbooks I have consulted, I have removed tonsils and adenoids and given thyroid, I have tried strychnine and arsenic With these methods I have had no success whatever

I have elicited the fact that children who wet the bed at night have also very irritable bladders by day At home they are constantly running to the lavatory, at school they are constantly asking permission to leave the room The obvious prophylaxis, then, is to bring the bladder under control I have therefore insisted on parents training their children to empty their bladders at fixed hours The child is not permitted, at first, to pass water for two hours, then for three hours, then for four, and so on When the child can hold its water for four or five hours, the nocturnal incontinence disappears The bladder becomes trained, just as the rectum can be trained to function properly

Exeter J Perfira Gray

PULMONARY GANGRENE FOLLOWING LINGUAL CARCINOMA

In view of the investigations which are being carried on under the auspices of the British Medical Association into the condition of cancer of the tongue, the following case, complicated by gangrene of the lungs, is not without interest

A man aged 44, came under my care on November 22nd, 1929, with a gummatous ulcer of the tongue of four weeks' duration, it was alleged to have been caused by the irritation of the right lower canine tooth He was given antisyphilitic treatment In April 1930, it was recognized that epitheliomatous degeneration had set in, and the lesion was regarded as inoperable The patient was by then confined to bed

The ulcer was about the size of an almond with heaped up irregular edges, and situated at the right edge of the tongue about its middle Around the ulcer the tissues were indurated Over the surface of the tongue there were marked evidences of leucoplakia The right submaxillary lymphatic glands were enlarged as also were the posterior cervical glands, those on the right side being more prominent than those on the left The tongue could not be protruded beyond the line of the teeth, which were very carious The speech was thick and slurring Sedatives were necessary to alleviate the pain of the ulcer The Wassermann reaction was positive

At 4 30 a m on May 15th the patient was seized with a severe coughing bout which was accompanied by the expectoration of bright red blood Feeling stifled, the patient began to pick bits of lung out of his mouth The attack lasted about forty five minutes The chamber pot, which was shown me when I arrived, was bespattered with bright red blood, and, in addition to pieces of foul, greenish black lung tissue, there was a single piece of lung tissue about 6 inches long and about 4 inches in its greatest breadth It was also greenish-black in colour, parts of it being streaked with thick yellowish mucus other parts with blood The patient, when questioned, alleged he had picked this piece of lung tissue out of his mouth with both hands Immediately the contents of the dish were burned These findings were confirmed by Dr M L M Thomson of Heworth, co Durham

When I examined the patient I found he was lying in bed quite passive His pulse was 106, and the temperature 98° F Rales and rhonchi were scattered over the front of the chest At 11 a m the patient had another profuse haemoptysis, again accompanied by the coughing up of small pieces of lung tissue A foul odour permeated the whole room Thereafter the patient's condition became quite passive, except for the presence of cough, the sputum, in a small receptacle, separated into three distinct layers, there being greenish black shreds at the bottom, above them a brownish purulent layer, and on the top a layer of mucus The patient died on May 25th, there being no further developments prior to his death

The chief interest in the case lies in the relatively large piece of sloughing lung tissue which came away ten days before the patient's death

Edward Collier, M B, Ch B Glas
Felling-on Tyne, Durham

ECLAMPSIA WITH UNUSUAL SYMPTOMS

The following case illustrates the importance of determining the systolic blood pressure immediately the slightest trace of albumin appears in the urine, and the difficulty of recognizing the potential eclamptic subject

The patient, a 2 para, aged 27, first attended the ante-natal department of the Leeds Maternity Hospital on March 21st Nothing abnormal was noted at this or at subsequent examinations until May 30th, the thirty second week of gestation, when the urine contained a slight trace of albumin The patient's systolic blood pressure at this time was 142, and in the circumstances she was given advice about rest, diet, and danger signals, and told to report again in a week's time On June 6th the amount of albumin in the urine was increased and the patient had some oedema of the ankles and a systolic blood pressure of 170 With great difficulty we persuaded her to come into hospital at once—namely, 11 30 a m The only facts worth recording in her previous history are that she had diphtheria at the age of 9, anaemia at 25, and had had a stillborn child with spinal bifida at full term in June, 1929

When the patient was admitted the regimen prescribed was bed, purgation, and a diet consisting only of water Later the same day she complained of epigastric pain and headache, and at 4 30 p m she suddenly had two eclamptic fits separated by an interval of fifteen minutes Morphine 1/4 grain, atropine 1/100 grain, and veratrone 1/4 c.c.m were administered intramuscularly, and lavage of the colon was carried out At 11.30 p m she had two more fits in rapid succession, and during the second fit was delivered of a stillborn female child with hare-lip and a depressed nose The placenta was small, bluish, and friable, and infarcted in many places, the cotyledons were flattened and the membranes were intact

The next day the patient was jaundiced Small petechial haemorrhages were present over the abdomen and flanks, but she suffered no visual disturbances, and no enlargement or diminution of the liver was detected Her condition gradually improved she took fluids, passed urine, had diminished oedema, and the blood pressure came down lower each day On the fourth day of the puerperium the jaundice was slight, the petechiae had faded, the systolic blood pressure was 148, and the patient's general condition was so much better that she was allowed a little tea and toast The next day, however, she felt not so well, her bowels acted several times, and at midnight she had three successive eclamptic fits without regaining consciousness between Morphine, atropine, and veratrone were given, no colonic lavage Up to date the bowels had been acting three to seven times daily

The following day the jaundice was more marked, the areas of petechial haemorrhage showed large blotches, and at 5 30 p m the patient, who had been rather restless and dazed, vomited bile-stained fluid She passed very little urine, and the amount remained scanty The area of liver dullness was still normal A day later—namely, the seventh day of the puerperium—the abdomen was distended, and gradually, in spite of treatment, became more so The systolic blood pressure was now 125 The patient gradually passed into coma, and on the eleventh day of the puerperium she died The systolic blood pressure had fallen to 98, the coma had deepened, and the abdominal distension had persisted Unfortunately, permission to hold a post mortem examination was not granted Beyond the details already mentioned the treatment consisted of the administration of diuretic drugs, turpentine enemata, and eserine, dry cupping, linseed poulticing to the loins, and the injection of intravenous saline with 5 per cent glucose

The point of special interest in this case is the occurrence of eclamptic fits on the fifth day of the puerperium in spite of (*a*) the absence of marked oedema, (*b*) the fact that the urine was at no time solid with albumin (though the absence of diuresis is to be noted), (*c*) the steady fall in the blood pressure, and (*d*) the ease with which the bowels were made to act Unfortunately we have no answer to the question What would have happened if hospital treatment had been adopted on May 30th?

I am indebted to Mr A M Claye for permission to publish this case

Henry R Sparrow, M B, B Ch,
Late Resident Medical Officer, Leeds Maternity Hospital

Reports of Societies.

THE TREATMENT OF HEADACHE

At the November meeting of the Chelsea Clinical Society, with Dr F J McCann in the chair, Dr Anthony Feiling opened an informal discussion on the treatment of headache

In the course of some remarks on syphilitic headache Dr Feiling said that if the headache was dependent upon an acute syphilitic meningitis, or rather acute syphilitic endo-arterial changes, he had seen considerable harm follow the treatment of the patients too actively, in the first instance with salvarsan and other preparations of that kind It was far wiser to give the patients for a week or ten days a preliminary course of iodides in increasing doses before using salvarsan preparations He added that the old statement that syphilitic headache was principally nocturnal was by no means true One very important group of headaches was due to organic affection of the brain These were headaches produced by injuries to the head, sometimes not severe they followed concussion and contusions of the brain They were found nowadays with increasing frequency as the result of motor accidents There was not the least doubt that a great many patients who had suffered from concussion, and in many cases also from contusions of the brain, were improperly treated, not as the result of advice or lack of it by their doctors, but because of their own obstinacy, it was impossible to make them take sufficient rest afterwards Some of these headaches were extremely persistent, and resisted almost every treatment The form of treatment to which he was specially inclined was the use of hypertonic solutions If a hypertonic solution was injected into the circulation, one of its effects was to cause a diminution in the volume of the brain In the type of case to which he was referring —namely these severe post-contusional, or post-concussional states—relief of the headache was obtained with the diminution in the brain volume A number of solutions were available for this purpose A solution might be given of as great a concentration as 30 per cent of sodium chloride in distilled water and it was possible to inject as much as 100 c cm of such a solution intravenously but it was seldom necessary to employ such a highly concentrated salt solution as that Much good resulted from the administration of a 15 per cent solution of sodium chloride in distilled water it was important that both should be pure and that the intravenous injections should be given slowly From 50 to 100 c cm of such a solution might be introduced Another very useful form of hypertonic solution contained glucose a 50 per cent solution could be given in the same way and was specially valuable when dealing with patients who had had more or less severe head injuries and were in a state of cerebral irritability The glucose itself had a certain advantage in combating shock and acidosis as well as a certain nutritive value in patients who were unable on account of coma or semi-coma, to swallow ordinary food In the milder states of these headaches one might get not such rapid, but quite satisfactory results with a highly concentrated solution of magnesium sulphate given by the rectum A 50 per cent solution of magnesium sulphate might be used, and from four to eight ounces be injected into the rectum slowly, with the idea of allowing the fluid to be retained as long as possible When giving injections of hypertonic solutions of this kind it was also important from the practical point of view, that the amount of fluid taken by the patient should be curtailed These injections produced a certain amount of thirst, and if the patient were allowed to satisfy his thirst fully a good deal of the benefit would be prevented

Another form of headache was sometimes called lumbar puncture" headache In many neurological conditions it was very desirable sometimes essential, to perform a diagnostic lumbar puncture and it was most unfortunate if such a procedure should be followed by extremely severe headaches It was therefore very important that every available method be adopted to prevent this, or to render any headache as slight as possible It was essential to perform the puncture with the patient lying down and not sitting up, also to use a proper needle (a great many of the needles sold were quite unnecessarily large and clumsy) The patient should be put to bed afterwards and kept there for twelve hours with the head low Perhaps it was of some value to give a large cup of tea or a pint of water immediately after the puncture Occasionally a commencing headache might be averted by a hypodermic injection of atropine One form of what the patient called "headache" was due to organic affection of the structures covering the head This pain in the head was due to some fibrositis or similar condition affecting the aponeurosis attached to the scalp, and was specially common along the line of the occipital crest It was more common in women than in men, and especially in women of middle age, at about the time of the menopause The most important methods of treatment in these cases were various physical methods such as massage and local applications of heat Vibro-massage was also useful In the more obstinate cases relief might be obtained by the local injection of strong alcohol into the tender points One had almost to shave the area where the pain was felt to make sure that the alcohol, preceded by an injection of novocain was injected only into the very limited area where the tender spot was situated

Dr Feiling next turned to headaches due to high blood pressure One of the most important elements in the treatment of these cases was rest perhaps not so much physical as mental With regard to the drug treatment of headaches due to high blood pressure, whenever possible it was better to do without recourse to drugs of the pure vaso-dilator type, they sometimes made the headache much worse He preferred to rely, in the first instance, on eliminative treatment in the form of purgation, and "blue pill" was often particularly valuable if there were no contraindication to its use in the shape of advanced disease of the kidney In many cases relief of headaches in high blood pressure would follow the use of ordinary bromides He had used two quite old fashioned drugs with considerable benefit in this type of case, especially with chronic interstitial nephritis—namely cannabis indica and antimony wine Diathermy was capable of lowering the blood pressure to a certain extent, and thus relieving many of the symptoms Headaches due to low blood pressure were a great deal more difficult to relieve, pituitary extract might have some value Chlorosis was said to have disappeared from medicine, but he felt sure that there were many minor degrees of chlorosis still to be found and largely unrecognized A considerable number of cases of minor chlorosis were found among young women who worked in banks and shops the chief complaint was headache, and often nothing more On the large subject of mental or emotional causes of headache he could hardly touch, though to the ordinary man in practice these cases made up a large proportion of those or which he was asked to prescribe Whatever theories one might hold about the mechanism of the production or symptoms in migraine there was not the least doubt that every case should be regarded as an individual problem for treatment Migraine in children could often be improved in the sense that the attacks could be rendered less frequent and less severe when they did occur by the adoption of the line of treatment recommended in so many cases of asthma in children—namely, treatment with glucose He had had several cases in children where the regular administration of glucose had certainly seemed to prevent the frequency at any rate of attacks of migraine but in grown-up persons he had not found the treatment to be of any value at all He supposed that migraine was an allergic disease, analogous to asthma Many attempts had been made to identify the particular cause He could not say that he had succeeded in alleviating many cases of migraine along that line of treatment A line of treatment was now being pursued on the hypothesis that the condition was due to some liver deficiency the treatment consisted of the administration of concentrated salts of magnesium sulphate either by the mouth, or, better still, by duodenal

intubation He had not had the opportunity of treating many cases himself, but he thought it deserved more extended trial In migraine there were certain old-fashioned remedies which were of value in diminishing the frequency and the severity of the attacks Small doses of luminal were of great value in many patients

In the course of discussion, Mr C J H Gunning said that very few errors of refraction were responsible for headaches Myopia did not give rise to this complaint When astigmatism caused headache it was usually when the axis of the cylinder was oblique, seldom when the axis was vertical or horizontal, and even in those cases of oblique astigmatism there were some in which full correction would still fail to relieve the symptoms Dr Ernest Young said that the so-called "bilious headache" was in his opinion due to some degree of hepatic insufficiency He found that many sufferers from these toxic conditions were people—girls especially—whose liquid intake was insufficient—less than a pint a day If these patients were put on two or three pints of water a day, together with perhaps a simple rhubarb mixture, the headaches cleared up quite well He believed many cases of migraine to be due to gastro-intestinal toxaemia, produced chiefly by excess of carbohydrate in the diet Dr Crewdson Thomas agreed that many sufferers from these toxic headaches did not take half enough liquid Mr Watkyn-Thomas drew attention to turgidity of the middle turbinate as a cause of headache, particularly in women Dr L D Bailey said that the headaches of high blood pressure could be relieved by the high-frequency current or diathermy, but it was necessary to be careful of the dose In the fibrositis of the occipital aponeurosis he believed the pain to be due to constriction of the blood vessels supplying the scalp and the occipital bone, and that by ionization it was possible to relieve these cases Mr Frank Cork remarked that certain French workers had announced their discovery of definite cases where migraine had been traced to certain specific diets

PRECANCEROUS CONDITIONS OF THE LARNYX

A meeting of the Section of Laryngology of the Royal Society of Medicine was held on November 7th, when Dr Chevalier Jackson opened a discussion on precancerous conditions of the larynx

Dr Chevalier Jackson said that this subject was of the utmost importance in the study of the problems of etiology, prophylaxis, and treatment of the "one disease," as Sir Henry Butlin had called cancer of the larynx The word "precancerous" was faulty, much time had been wasted in discussions by not beginning with a definition, so that the participants were not talking about one and the same thing If the word was employed to indicate a stage always traversed in the transition from the normal to the neoplastic, it was doubtful whether there was sufficient evidence to justify its use If the word was taken to imply only a soil favourable to the development of cancer, little fault could be found, and discussion would be useful The condition of the tissues before the development of cancer might hypothetically be described as a preparation on the part of the cells to do something not already done Metaphorically it might be likened to a large number of the citizens across the border leaving their daily routine and mobilizing preparatory to invasion Similar misbehaviour on the part of the cells that had not yet crossed the border was often visible near an area where invasion constituting cancer had already begun Occasionally it was seen without any subsequent invasion Any inflammatory or irritative condition in the larynx might be called precancerous but such use of the term would be a very loose application indeed The condition was, perhaps, very rarely recognizable as a histologically proven fact To ask the histologist to state from the examination of dead removed cells what the adjacent, living, unremoved cells were going to do was asking much yet occasionally this had been done on the basis of probabilities An illustrative example had been published by Dr Jackson in the *Proceedings* of the American Laryngological Association for 1922 Sir StClair Thomson, Mr Herbert Tilley, the late Mr Hunter Todd, and Dr Jackson, from mirror examinations, had concluded that the condition in the larynx of a man aged 42 was suspicious Histological examination by James Ewing demonstrated a cellular structure to which the term "precancerous" could conveniently be applied, inasmuch as the deeper cells were misbehaving, and showed a sudden transformation of the normal to the hyperplastic, with the appearance of typical epithelial pegs, but they had not yet invaded the submucosa Dr Ewing had added the comment, "This is the stage in which to treat cancer of the larynx, not after it gets well advanced" Laryngo-fissure, with moderately wide removal, completely cured the condition, the patient was now in good health, with a good voice, after fourteen years In contrast with this case were those in which a chronic laryngitis was followed by a stealthily developing cancer after many years, as long as thirty in some of Dr Jackson's cases A precancerous stage might exist in such patients, but it was unrecognizable The clinical indications for treatment were clear, though not always easy of accomplishment Every curable disease of the larynx and upper air passages should be cured, and all incurable conditions should be ameliorated so far as possible Avoidance of all forms of laryngeal irritation was imperative Vocal rest and avoidance of alcohol and tobacco should be insisted upon At the first sign of cancer a microscopical examination should be made, further treatment would be based upon the histological findings

CHRONIC ABDOMINAL PAIN

At a meeting of the Sheffield Medico-Chirurgical Society on November 5th, with the president, Professor Graham Simpson, in the chair, Dr E F Skinner opened a discussion on chronic abdominal pain

Dr Skinner said that in discussing chronic abdominal pain it was essential to define the terms First of all, were they to understand by "chronic" merely a long-continued pain, or might they include recurring pain? Secondly, did the term "abdominal" refer only to the viscera, or did it include the parietes? Thirdly, it must be remembered that what was pain to one patient was mere discomfort to another Two generalizations must be considered when dealing with any question of pain The first was that its intensity varied inversely as the nervous stability of the individual, not only because of the original nervous make-up, but also because of the lowering of the threshold for pain consciousness which ensued in long-continued illness The second was that the significance of pain varied inversely as the richness of its description—the more flowery the language, the less credence was to be placed on its intensity All were familiar with Bramwell's patient "plump as a partridge," who suffered terrible agonizing pains all over the body During the previous two or three years Dr Skinner had been struck with the fact that the patients who complained most of pain suffered from "functional" rather than structural organic disease, patients with definite structural changes made the least complaint Some illustrative cases were described His experience suggested that pain was an uncertain guide to diagnosis in many cases, and he commented on the number of "congested appendices" removed annually from an otherwise healthy abdominal cavity There might not be many, but the speaker suspected that a considerable number of such operations were performed merely on the grounds of chronic abdominal pain The only pain which was really of diagnostic aid was that type of referred pain which had definitely anatomical localization, such cases did not bulk largely in those covered by the title of the discussion Apart from referred pains, chronic abdominal pain as a diagnostic aid was of doubtful value

Mr E Finch said that in order to appreciate the extent of pain complained about it was necessary to know the "language" of the patient and the circumstances of its

origin. Clinically one had to regard pain and disease as synonymous, though the disease was by no means necessarily in the abdomen. From a clinical point of view pain could be regarded as due to tension. The spontaneous pain reported by a patient was as a rule vague and very ill defined. It might become more localized as the peritoneum became involved but it was then usually accompanied by physical signs. At the present time however clinical experience generally had to interpret the cause of pain. Pain being a purely subjective symptom there was a natural tendency to refer the patient at once to the radiologist or to the biochemist for further tests and thus one of the most important method of examination—namely a careful clinical history—was apt to be neglected. Pain in the right iliac fossa in a patient over the age of 50 might be due to a growth of the colon when no other physical signs could be found. Mr. Finch thought that chronic appendicitis could occur in the adult without a previous acute attack though this was not so in the child. He doubted very much whether calcareous glands were a cause of abdominal pain. He referred to the difficulty of assessing the value of adhesions as a cause of pain unless they produced obstructions: he was also doubtful whether visceroptosis *per se* would account for pain. The question of operation for chronic abdominal pain with no physical signs was a matter of weighing up evidence in arriving at a decision the most valuable opinion was that of the family doctor.

Mr. W. W. King said that pain due to retroversion or prolapse was relieved by lying down, if caused by pelvic inflammation endometrioma or the malignant invasion of tissues it was not much influenced by posture and might even be worse at night. Recurrent pains were generally intestinal rather than uterine in origin. Retroversion—actual partial or imaginary—had been blamed for much pelvic pain which was not necessarily caused by it. A mobile retroversion did not give rise to pain in nulliparae or in women after the menopause. Retroversions in parous women were not always painful and the pessary test was valuable in such cases: if the pain was relieved and recurred after the removal of the instrument an operation could be confidently advised. If the pessary test was not applicable to a particular case operation might give relief but it was uncertain. From records he found that he had operated upon six 'untested' patients with retroversion who had complained of abdominal pain: four had been cured while two were not relieved. A failure rate of one third showed that a surgeon should be as careful in advising such operations as in forecasting their results. Endometrioma was one of the commonest and the least generally recognized causes of abdominal pain. The large masses were easily recognized but a small nodule often caused great suffering. The pain was generally described as being more or less continuous and unrelieved by rest: it was liable to exacerbations especially at the periods. The onset was often acute and accompanied by vomiting and thus not infrequently simulated appendicitis or renal or gall-stone colic. The typical symptoms were abdominal pain dysmenorrhoea dyspareunia and rectal pain. In some cases a tender retrocervical nodule or very rarely blue vaginal cysts could be found on vaginal examination. An almost diagnostic sign was thickening and intense tenderness of one or both utero-sacral ligaments. Mr. King had been treating these cases with diathermy and an analysis of the follow-up showed that of thirteen patients so treated ten reported themselves to be cured. The three failures represented either an incorrect diagnosis of the real cause of the pain or a recurrence of the growth.

Dr. Wilkie showed skiagrams and gave the clinical history of cases of abdominal pain caused by lymphatic leukaemia syphilis of the stomach malignant growth of the lung calcification of the pleura and osteo-arthritis of the spine. Dr. A. C. Yates said that chronic abdominal pain might be caused by diseases outside the abdominal cavity. Persistent pain was sometimes due to panniculitis. The thick fold of subcutaneous fat felt indurated and might be mistaken for a more deep seated lesion. It was a good rule always to examine the pupils and the reflexes in cases showing abdominal symptoms. The abdominal crises of tabes might simulate gastric duodenal or other lesions. Nerve root irritation by tumour or spinal caries were other possible sources of error. The functional cases and especially the cases of so-called visceroptosis were perhaps the most difficult of all: they afforded good examples of Adler's organ inferiority. The poor abdominal development narrow chest and acute subcostal angle with displacement downwards of the abdominal viscera constituted a perfect nidus for the development of a psychoneurosis: the pain in these cases though real was psychological, and constituted a means of escape from some intolerable situation. Dr. Archibald Young spoke of the humiliation which the practitioner felt in ascribing the pain to some undetermined gastric disorder. It was often the line of least resistance to accept the patient's own diagnosis of "a gastric stomach." Exact diagnoses by means of x rays and fractional test meals were impracticable for all cases. Years of practice developed a clinical intuition which enabled one to select the right cases for complete investigation. He agreed with Dr. Wilkie that either tuberculous or grinders' phthisis could cause chronic abdominal pain. Early myocardial degeneration was frequently shown by abdominal pain. He believed that chronic constipation was a great cause of pain which often simulated duodenal ulcer: such cases could be cured by paraffin medication. He gave instances of abdominal pain caused by rheumatoid arthritis of the spine. With reference to the toxic causes of chronic abdominal pain lead poisoning had now been almost eliminated but he had had a case of abdominal pain from the surreptitious drinking of laudanum. He did not think that a movable kidney existed frequently without general visceroptosis and added that the greatest disservice which could be done to a patient was to tell her of her misplaced organ. Dr. Harrison had found that certain types of work were liable to cause abdominal pain. He told of cases in which pain had disappeared on ceasing to work a treadle sewing machine.

Dr. Mackinnon saw no reason why the analogy of the hysterical knee where all symptoms often disappeared after an exploratory operation should not apply to the abdomen. In such cases the appendix might be regarded as the surgeon's friend and even the removal of a normal appendix might be held to justify operation. An abdominal operation for "unclear" cases often led to no improvement and such patients frequently underwent repeated laparotomies. A striking feature in these cases was the willingness and even eagerness with which many patients submitted to further operation that possibly might be regarded as some measure of the degree of their suffering. Where pain was the only symptom unless there seemed to be a reasonable likelihood of finding something wrong in the abdomen he thought an operation should not be embarked upon lightly. In a child with a history of chronic abdominal pain nothing could be found to account for it but an x ray examination revealed the presence of calcareous gland. Dr. R. K. Robertson thought that constipation was often due to the patient's ill-advised attempts at self treatment by purgatives. Bony changes in the spine which caused pressure on the nerves deserved more attention. Mr. Finch had justly stressed the importance of tension, probably fewer mistakes would be made in any case of pain if the question were asked whether there was anything causing tension in any of the viscera. Mr. Finch had also instanced pain in the caecal region due to stricture of the gut in the pelvic colon. Professor Wilkie had first called his attention to this nearly twenty years ago.

Dr. Cuthbert Barnes remarked that patient with chronic abdominal pain might be classified as those who had a disorder of function and those who had an organic lesion. The cases could be subdivided into those who had had and those who had not had abdominal operations. Post-operative pain was frequently the expression of an "anxiety or an exhaustion neurosis in relation to the operation. It was often the sensory nerve at the site of the operation which were disordered. Organic causes for post-operative pain were adhesions or ventral hernia. Dyspepsia was the chief cause of pain among those who

had not been operated upon Both hypochlorhydria and hyperchlorhydria could cause chronic pain, the former was rare, but the latter was very common Before ulcer (gastric or duodenal) developed there was apparently a long history of this disorder of gastric function Chronic abdominal pain was caused by constipation in neurotic subjects When there was some organic lesion to account for the pain it might be in the abdominal wall He drew attention to the difficulty in recognizing renal causes for chronic abdominal pain in the absence of other symptoms The PRESIDENT summed up the discussion briefly He suggested that since the causes of abdominal pain were so numerous, and occurred in such diverse regions, the surgeon should cultivate the long abdominal incision after availing himself of all the resources afforded by x rays and the laboratory

CLINICAL AND HISTOLOGICAL CHARACTERS OF PARKINSONISM

AT a meeting of the Pathological Society of Manchester, Professor J S B STOPFORD opened a discussion on Parkinsonism, by detailing the underlying anatomical features of the condition

Professor Stopford first described the cortico-spinal pathway, and then the extra-pyramidal system which was the site of the more important pathological changes in the various diseases giving rise to the Parkinsonian syndrome He gave an account of the basal ganglia, and in particular of the fibres arising in the cells of the globus pallidus, which passed down to the red nucleus and the substantia nigra Some of these fibres from the red nucleus decussated and formed the rubro-spinal tract, while others from the substantia nigra seemed to decussate with the pyramidal fibres, and eventually to form connexions with lower motor neurones

Dr F R FERGUSON referred to the original description of the "shaking palsy," by James Parkinson in 1817 The term "Parkinsonism" was comparatively recent, and referred, not to a disease, but to a syndrome caused by a lesion of the extra-pyramidal tracts, and consisting of three features (1) rigidity, which occurred proximally rather than distally, affected the flexor muscles rather more than the extensors, and was cogwheel in type, (2) disturbance of movement characterized by easy fatigue, slow, irregular, and limited movements, inability to maintain contraction, poverty of movements, and loss of movements of co-operation, and (3) tremor These three features affected different parts of the body, giving the typical picture of Parkinsonism, which Dr Ferguson detailed he concluded by describing the different types of the syndrome and their pathological causation, the commonest type now was the chronic encephalitic type There were also the idiopathic (paralysis agitans), arterio-sclerotic, syphilitic, neoplastic, senile, and a few rarer types

Dr CRITCHLEY described the pathology of the syndrome In true paralysis agitans no part of the central or peripheral nervous system was immune, for changes occurred throughout the cerebrum, cerebellum, spinal cord, and even the neuro muscular junctions The diseased process was exaggerated in certain areas of the brain, notably in the basal ganglia (especially the globus pallidus) and the mid-brain (in particular the substantia nigra) The changes were microscopic, consisting of a diminution of the ganglion cells which had an unhealthy appearance, a disintegration of myelin, and an overgrowth of glia In the arterio-sclerotic type there were obvious naked-eye changes, taking the form of lacunae of disintegration in the basal ganglia Histologically, the changes were those met with in paralysis agitans, but in addition there was evidence of arterio-sclerosis, and a condition of sponginess of the globus pallidus due to focal thrombosis and softening In the chronic encephalitic type subacute inflammatory changes were found in the basal ganglia and mesencephalon There was cuffing of the lymphocytes, and in the substantia nigra masses of pigment could be seen lying free Dr Critchley concluded by describing the pathological processes encountered in certain of the rarer types of Parkinsonism

MOUTH INFECTION AND PUERPERAL SEPSIS

AT a meeting of the North of England Obstetrical and Gynaecological Society, held in Manchester on October 24th, with the president, Dr J W BURNS, in the chair, Dr A S GARDEN (Southport), in a communication on mouth infection as a cause of puerperal sepsis, described a series of four cases which had occurred in the Southport Maternity Hospital of parturient women developing fever from uterine infection The first was delivered normally on January 19th, and developed a temperature of 102 6° F two days later *Streptococcus pyogenes haemolyticus* was isolated from a cervical swab The second patient was delivered by low forceps on January 24th, and two days later had a rise of temperature The third patient on January 29th developed a rise of temperature on the second day, when the fourth case was confined, and her temperature rose on February 11th The throats of the entire staff were then swabbed One nurse was found to harbour haemolytic streptococci without symptoms She was isolated from the wards, all members of the staff then wore masks during confinements and swabbings, and no further rises of temperature occurred

Dr Garden quoted the observations of Mr W W King in an article of the *British Medical Journal* of March 26th, 1930, also Dr Kinloch's report on "Maternal mortality in Aberdeen, 1918 to 1927, with special reference to puerperal sepsis," and said that in April, 1930, he personally supervised a normal delivery with a view to taking observations from this point of view The acting midwife, who wore a mask, admonished and encouraged the patient with words in which there was a frequent use of sibilants and labial consonants He concluded that aseptic and antiseptic precautions are better carried out in a maternity hospital than in the home, that the danger from "spray" in institutions is greater because of the elevated labour bed, and that with more assistance there is more talking and "spray" He stressed the point that dialect plays an important part He recommended that in all cases effective masks should be worn

Cases and Specimens

Dr Garden then described a case of cancer of the cervix complicating pregnancy The patient was treated from the thirty-sixth week as a case of placenta praevia right through the labour, which was terminated by Cæsarean section twenty-four hours after its commencement She died of general peritonitis, and at necropsy the placenta was found to be at the fundus, but the cervix was invaded by a mass of carcinomatous material He presented this case to show the difficulties which might arise in diagnosis, and to seek the advice of the society to avoid such an error in this class of case The case was discussed by the PRESIDENT and Drs FLETCHER-SHAW, MALLAM, BRIDE, DOUGAL, and KING

Dr J W BRIDE (Manchester) showed an abnormally large fibroid, weighing 14 lb, which he had recently removed The patient was aged 52, and her chief complaint was loss of weight and indigestion She had noticed the swelling only for a few months He then described a tumour of the abdominal scar following ovariotomy, to elucidate the conclusion that ovarian cysts should be removed entire through a large incision rather than by tapping Five years ago he had removed two very large ovarian cysts and the uterus by supravaginal hysterectomy from a nulliparous woman, aged 38, in whom he had resorted to tapping first These cysts were reported to be pseudomucinous cysts When he saw the patient this year, she had a small swelling the size of a walnut in the right groin, with a larger one the size of an orange in the abdominal scar The latter, when removed at operation, was found to infiltrate the recti muscles, but did not invade the peritoneum The lump in the right groin was encapsulated and easily removed Dr Bride compared its growth to implantations of endometriomata in abdominal scars The gross appearance of the tumour was one of myxoma Dr DOUGAL, in discussing the case, suggested that it was a pseudomucinous cyst becoming malignant

Dr C P BRENTNALL (Manchester) showed radiograms of general oedema of foetus, and imperfect development of foetal skull resulting in complete extension of head

Reviews

ASPECTS OF MODERN BIOLOGY

Der nordische Mensch Von Halfdan Bryn Munich J F Lehmann (Med 8vo pp 166 126 figures 10 maps M 9)

Man and Animal in the New Hebrides By John R Baker D Phil Oxon London C Routledge and Sons Ltd (Demy 8vo pp xv + 200 43 figure 12 6d net)

Medizinische Anthropologie Von Oswald Schwarz Privat dozent an der Universität Wien Leipzig S Hirzel (6 × 8½ pp xx + 333 M 13)

Biological Principles By J H Woodger B Sc International Library of Psychology Philosophy and Scientific Method London Kegan Paul Trench Trubner and Co Ltd (Demy 8vo pp xii + 493 21s net)

THE four works noted here serve to illustrate how varied the field of modern biology has become

The first is devoted to a study of the people of Norway—their physical characterization, their racial nature, and their origin It is written by Mr Halfdan Bryn, a magistrate of Trondhjem who for many years has devoted his spare time to a systematic and exact investigation of the people of his district, and has earned for himself a high place among those European anthropologists who approach the study of human races from a biological point of view His object in writing the present work is to place before the world a true picture of the Nordic race as seen in the country where it reaches its purest development—Norway The second work written by Dr J R Baker demonstrator in the Department of Comparative Anatomy in the University of Oxford, provides us with an account of the fauna of an isolated group of islands in the Pacific—the New Hebrides Dr Baker is a biologist with a catholicity of interests during his two visits to the New Hebrides he was able not only to extend our knowledge of their corals their mosquito and their bats but also of their native inhabitants and of the pigs bred by them His observations made on the inhabitants should be studied by our statesmen His dissections of pigs throw light on a problem which has a direct interest for medical men—the imperfect differentiation of sex In certain herds or breed of pigs in the New Hebrides over 10 per cent of the young are born neuters—imperfect males In the third work noted here Dr O Schwarz of the University of Vienna applies to the elucidation of human diseases and disorders biological concepts which have been formulated by modern philosophers and psychologists For him medicine is a department—an empirical department—of biology The fourth work on our list like the previous one, is philosophical in nature It is written by Mr J H Woodger lecturer on biology Middlesex Hospital Medical School who in the first page reproduces quotations from Locke's *Essay Concerning Human Understanding*, J S Mill's *Logic* and Professor A N Whitehead's *Science and the Modern World* and thus prepares us for the contents of his book *Biological Principles* Hitherto biologists have been content to observe and record facts, and to give explanation of these facts Mr Woodger is convinced that they must take a third step if biology is to be reckoned a science in the same case as physics they must make certain that their methods of observation and of thinking will pass the criticisms of modern masters of logic and metaphysics Mr Woodger's treatise is a criticism of the dicta accepted as truths in modern biology It is to be feared that if Mr Bryn Dr Baker or even Dr Schwarz had read and accepted the teaching of Mr Woodger they would have hesitated before writing books which if profitable for those in search of knowledge are probably very defective from a metaphysical point of view

In their respective ways all the works just mentioned represent additions to our knowledge of biological processes Norway offers ideal conditions for natural experiments in the evolution of human breeds or type The inhabitants of each narrow long inland valley are semi-isolated inbreeding communities It is in these inland valleys that Mr Bryn finds the most distinctly differentiated Nordic types—types marked by the tallness of their stature the whiteness of their skin the blondness of hair blueness of eyes projection of occiput and narrowness of face In some valleys almost every member of the community is so marked Along the western coast however there are numerous communities in which the Nordic characters disappear and are replaced by hair, eyes, and skin showing grades of pigmentation heads tending to roundness stature to squatness and faces to width rather than to length Mr Bryn seeks for an explanation of the presence and distribution of these two contrasted types of Norwegians in the events of prehistory He regards the blond inhabitants as the first to settle in Scandinavia, and looks upon them as the descendants of people who lived in Europe during the latter phases of the Ice Age The darker, round headed people of the coast are later settlers coming from the south and reaching Norway by sea The same dark, round headed racial element occurs in Wales The narrow Nordic face prevails in Britain as well as in Norway

The black skinned, woolly headed New Hebrideans are the antipodeans of the blond people of Norway and yet, if we are to believe Maddison Grant and his school, these opposite types of humanity present a common problem It is said that the Nordic type is perishing in Europe and America, there can be no doubt that in the New Hebrides the Melanesian type is passing rapidly towards extinction During his two visits to the islands Dr Baker applied himself to the native problem"—Why are the local communities dying out He gives a list of circumstances—twenty-five in number—which are supposed to be concerned in the extinction of native races He admits as valid the introduction of diseases to which natives are highly susceptible and to which white men are more or less immune, and the practice of abortion Symptomatic of racial decay is the predominance of males over females in the general population in native communities Dr Baker found that there were 159 males for every 100 females A hundred mothers had only 128 children among them Whether the women wished to bear children but could not, or whether they could and would not has still to be determined If the people are to be saved Dr Baker is of opinion that it will be necessary to withdraw all foreign settlers isolate the islands and permit the natives to work out their destiny in seclusion and in their own way Whether such a policy if practised in all regions of the world is best for the ultimate good of humanity is a matter which is seriously open to question Hitherto all communities have been exposed to the trying winds of competition

It is very possible that readers may be attracted to Dr Schwarz's book by its attractive title—Medical Anthropology If they expect to find in his pages the fruits of modern anthropology applied to the elucidation of human disorders and diseases they will be disappointed Dr Schwarz looks upon anthropology as another name for the biology of mankind Some day it may become so and when it does it will represent the foundation for a science of medicine Meantime Dr Schwarz is mainly concerned with definition—the definition of 'type" of class" of health' of 'sickness' of what "medicine' is and what it is not His conclusion is that the cure of most modern evils is to be found in psychotherapy

Mr Woodger's *Biological Principles*, like that of Dr Schwarz is a work of great erudition and is primarily intended for the instruction of expert biologists Mr Woodger, in applying the latest concepts of space and time, of the epistemologist methodologist and metaphysician, to an examination of the foundations of modern biology, proves himself to be a destructive rather than a constructive philosopher Of modern physiologists he writes Biological problems always present themselves to physiologists with a childish simplicity which is almost touching" Nor do zoologists fare any better at his hands He asserts that Professor Goodrich's account of variation seems to be very muddled, and yet to the ordinary reader the account cited seems as clear an expression as the English language permits He is even more severe on students of the human brain, and gives "a few illustrations of the horrible confusions into which neurologists are led by mixing psychology (or what they suppose to

be psychology) with their neurology" Indeed, Mr Woodger regards those functions of the living brain we speak of as "mental" as being outside the scope of biological inquiry, and capable of elucidation only by metaphysical methods of inquiry The fact remains that such advances as have been made in our understanding of man's mental reactions are the result of the application of biological methods

We see in these four works on biology a hope for the future They indicate a tendency, as biology expands, to synthesize as well as to specialize It is well, too, that biologists should be conscious of their assumptions as well as precise about their facts

A K

DIAGNOSIS OF DISEASES OF THE CHEST

That a fourth edition of Norris and Landis's *Diseases of the Chest*[1] has been found to be necessary shows that the book has met a demand among clinicians, for whom it is particularly designed It details at some length the physical diagnosis of the heart and lungs in health and disease special emphasis being laid on the pathological condition underlying each physical sign, but no attempt is made to describe treatment or discuss prognosis The present edition has been revised and new material added The book is divided into four parts The first two concern the examination of the lungs and circulatory system respectively and comprise one-third of the volume More than is the custom has been written on the subject of diagnostic acoustics, for the authors believe that only through comprehension of the laws of sound production and transmission can the results of percussion and auscultation be intelligently interpreted The last two sections describe the diseases affecting the two systems, giving a number of important references Each disease is described in detail, and many varities are included Indeed, the authors believe that little of practical value has been omitted, but there does not appear to be a reference to pulmonary asbestosis, a condition which has recently attracted much attention in this country They lay stress on the advantages of using the bronchoscope in the diagnosis of pulmonary disease, not only as a means of seeing the condition of the larger bronchi, but also for removing from the smaller bronchi uncontaminated specimens of secretion for bacteriological study The section dealing with the pericardium, heart, and aorta is the best part of the book, in particular the descriptions and illustrations of pericardial disease being noteworthy There is a good chapter by Dr Krumbhaar on the electrocardiograph The authors endeavour to teach as much as possible by means of illustrations, and have included nearly five hundred in the volume Of these, many are from photographs of frozen sections from the cadaver, previously hardened in formalin, so that the anatomical relations remain as during life Such specimens have been found invaluable for teaching and their inclusion is the novel feature of the volume They are not, however, always used to the best advantage, and this applies also to certain of the radiograms Some show the thoracic viscera viewed from the front while others show the heart apparently on the right side of the chest as though the specimen was being observed from behind, and it is at times difficult to decide at first glance which is the left and which is the right side There is moreover a tendency to overdo the inclusion of these illustrations and in some cases photographs of fresh material would have been more suitable But taking them all round the illustrations are very good

The volume contains much that is excellent, and yet despite this it is somewhat disappointing, for the descriptions are long and are not always clear Yet it is a book that has claims upon the clinician's attention He will find much of interest in its pages regarding the examination of patients, and many of the pictures of frozen sections are striking, and are ideal for teaching purposes

TREATMENT OF SKIN DISEASES

A teacher of dermatology is often told by old students how much they regret the lost opportunities of learning more about skin diseases when at hospital In *Modern Skin Therapy*[2] Dr Haldin-Davis has done much to remedy the defect, for in his small book—it has no more than 128 pages—he has succeeded in assembling the principles and technique of treatment of those skin diseases which are usually met with in general practice, and which so often prove troublesome both to the practitioner and to the patient There is no confusion of thought here, the author knows how to use his wide experience for the benefit of others The directions for treatment are clear and succinct, and cover a wide range, including the recent developments in actinotherapy and protein shock methods They are, further, essentially of a practical nature, and, with the exception of radium and x rays, require nothing that is outside the scope and usage of general practice Some writers balk their readers by their dullness Not so Dr Haldin-Davis, whose pleasant style entertains the reader while he seeks instruction There was a very real need of a book of this kind, and the author has hit off exactly what is required The result is an admirable little book which cannot be too highly commended

EPIDEMIOLOGICAL ESSAYS

Among the acute experiences of medical practice in comparatively recent years the recurring epidemics of influenza and the appearance of encephalitis lethargica must be allowed as noteworthy events The latter, after various hurried interpretations, became widely accepted as a "new disease," while at the same time wider experiences showed that not all its forms were attended by lethargy, and that for this and other reasons epidemic encephalitis was a more suitable title In his collected *Epidemiological Essays*[3] Dr F G Crookshank is largely concerned with the claim that, so far from being an isolated and individual clinical picture, epidemic encephalitis is merely one of the forms in which influenza manifests itself, and, further, that in the same series are to be included epidemic poliomyelitis, encephalomyelitis, and various outbreaks of acute disease recorded in the earlier centuries under such names as sweating sickness, frousse-galant, pestilential fever, acrodynia, and perhaps some groups labelled ergotism or botulism The accurate view, it is urged, is the view which recognizes an essential unity between the non-nervous manifestations of influenza and the nervous prevalences which may be, and frequently are, associated with these or substituted for them In other words, influenza is responsible not only for epidemics of catarrhal disturbance, but also for epidemics of nervous disturbance

A further proposition of interest relates to the circumstances in which outbreaks of influenza occur The periodicity of these outbreaks has attracted much attention, and the late Dr Brownlee calculated on the basis of the mortality returns a thirty-three-week periodicity, subject to a certain limited exception With this conclusion Dr Crookshank does not agree After a study of the records of some five hundred years, he concludes that influenza shows a tendency to occur about the time of the equinoxes, that there is an epidemic outbreak every ten or eleven years, and that three times in the course of a century or so the disease assumes a particularly conspicuous activity Moreover, the interest of these conclusions is heightened by the suggestion that there is a correlation between epidemics of influenza on the one hand and general magnetism on the other, and that in this fashion modern observations on cosmic and telluric phenomena are in harmony with the Hippocratic aphorism that "with the seasons, men's diseases, like their digestive organs, suffer a change"

If to some readers all this seems somewhat fanciful, Dr Crookshank may fairly ask for an examination of

the evidence. In collecting this he has displayed great industry and critical acumen, and he presents his case in forcible fashion and with a combative zeal that adds brightness as well as vigour to the argument. From the individual text, too, he passes to certain issues which apply widely in the field of medical philosophy, and for our own part we think he preaches much sound doctrine. Some of his essays are in lighter vein, but they are none the less excellent reading. Like the rest of us, Dr. Crookshank has his antipathies, and the "reviewer in medicine" is one of them. Doubtless this is an exhibition of what Charles Lamb called "imperfect sympathies," and with it, therefore, we will find no cause of quarrel.

AFTER CONSULTING HOURS

In the preface to his little book entitled *After Consulting Hours*[1] the author, Dr. CHRISTOPHER HOWARD, says that it consists of "a series of more or less disconnected reflections." He is modest enough to disclaim any particular value for them, but hopes they may cause thought in others, and "play their humble part in the achievement of the truth." This is probably their chief value as well as their ostensible aim, and they may be commended to Dr. Howard's medical brethren as containing a good many wise thoughts and a considerable number of useful suggestions, both about methods of practice in general and as regards the details of treatment in particular cases. Moreover the book is written in excellent English, and is eminently readable. The reflections are sorted into chapters under the headings "medical," "general," "sexual," "therapeutic," "appendicular," "circumcisional," "mixed," and "terminal," but in quite a large number of cases there is no very good reason for placing some pages in one chapter rather than in another. The author of course, has his idiosyncrasies and peculiar preferences; this is part of the charm. He has studied a good deal in France evidently, and so is able to introduce and to commend a number of methods and preparations which are not so well known in this country as they might be. He makes large use of the intravenous or intramuscular methods of administration, and has some sensible words to say about endocrines. Probably he has more faith in the therapeutic virtues of carefully chosen alcoholic drinks than is nowadays common, and he exhibits a strong prejudice against the drinking of coffee after lunch or dinner. He reveals too how he thinks he might be tempted to consider suicide while in Cheshire though it would never occur to him in Suffolk. Altogether this is a pleasant little book revealing an attractive personality, and containing a sufficient number of helpful and common-sense observations to make its reading worth while.

NOTES ON BOOKS

MANY radiologists, especially those engaged in x ray therapy, will welcome a translation into English of the second edition of *Dosage Tables for Rontgen Therapy*[2] by Professor FRIEDRICH VOLTZ. To the first German edition, which appeared eight years ago and was reviewed in our columns on February 11th 1922, many alterations and additions have been made, and the book has been brought quite up to date. After a short introduction the author deals with the question of the spreading, the absorption, and the scattering of x rays. He then discusses seven cardinal points in this form of therapy—namely, the physical dose, the biological dose, the dosage quotient, the percentage deep dose, the effective dose, the practical dose, and the absolute unit of dosage. Following these two chapters a third takes into consideration the three methods of measurement—namely, the iontometric and photographic methods and measurement with the selenium cell. All these chapters are illustrated. The dosage tables, some sixty-five in number, follow in three groups with a few explanatory notes, and the concluding chapter is given up to a consideration of the calibration of x ray apparatus and x ray tubes. As the author says in his short preface, this is not a prescription book; it is directed entirely towards the estimation of physical quantities and its object is to assist the practical radiologist to estimate dosage without the necessity for long measurements and repeated calculations.

A revised and enlarged edition of the *Catalogue of British Scientific and Technical Books*[3] has been issued by the British Science Guild, containing almost 14,000 titles—more than double the number in the original volume published in 1921. As the catalogue is limited to books published by British firms and appearing in their lists up to September 1929, it may be regarded as an up-to-date guide to British scientific literature so far as textbooks and books of reference in the fields of science and technology are concerned. About 600 entries appear in the section of medicine, excluding those under surgery, gynaecology, and dentistry. A detailed description is given of every volume, including the name of author or editor, the title, size, number of pages, date of last edition, publisher, and price. In this third edition the general plan of its predecessors has been followed, but a slight rearrangement has been made to provide a more convenient grouping of subjects and the subdivision of a number of headings. The catalogue is completed by name and subject indices, and can be thoroughly recommended for its practical use both to the specialist and to the general inquirer.

MR. DE VERE STACPOOLE combines the skill of the accomplished story-teller with the grace of the scholar in blending the colour, the fragrance, the bizarre types and the sinister violences of the islands of the Seven Seas. Most of his *Tales of Mynheer Amayat*[4] head of the Tavas Agency of Sandakar and Salong have their setting in the Dutch East Indies. All of them have a genuine thrill, several spring ingenious surprises, but what distinguishes them from the ordinary run of detective stories, apart from the lucid and liquid style, is the fact that the *clou* is usually some abnormal condition or peculiar trait—somnambulism, forms of suggestion, a facial resemblance, colour blindness. The narrative glows with beautiful objects—pearls, sapphires, rose jade carvings—and is full of acute and vivid observation. "Dead Girl Finotte" is macabre in an original way, and "The Amazing Story of Wang" is a fine piece of ironic comprehension. This is an entertaining book; its author (as becomes a member of the medical profession) wearing much knowledge very lightly.

The Child's Conception of Physical Causality[5] is a translation into English of an important series of careful investigations on children carried out by Professor JEAN PIAGET of the University of Geneva. Three previous studies by the same writer have already been made accessible to English speaking readers and are included in the International Library of Psychology, Philosophy, and Scientific Method. In the concluding section of the present work the writer summarizes the conclusions reached in this work and in his last book, *The Child's Conception of the World*.

The biography entitled *The Beloved Physician Sir James Mackenzie*[6] by Dr. R. McNAIR WILSON was reviewed in the *British Medical Journal* of October 30th 1926 (p. 791) when it was recommended especially to the young practitioner for its skilful exposition of Mackenzie's life work. A well printed cheaper edition has now been published containing a portrait.

The second volume of the *Collected Papers*[7] of the Rowett Research Institute, Aberdeen, gives some account of the developments that have occurred at the Institute since the issue of the first volume in 1925. The experimental stock farm, which comprises nearly 1,000 acres, is expected to be completely established in the course of the present year. In 1929 the Imperial Bureau of Animal Nutrition was instituted as a clearing house for information on nutrition and allied subjects for the benefit of research workers throughout the Empire. Owing to the increasing number of post-graduate students and visitors from overseas the governors have decided to build a residence for temporary workers in the vicinity of the Institute. During the last four years members of its staff have been sent to Palestine, New Zealand, and East Africa to co-operate with agricultural or medical departments. The present collection of papers has been added to the Library of the British Medical Association.

VITAL STATISTICS FOR ENGLAND AND WALES

THE REGISTRAR-GENERAL'S REVIEW

In a recent memorandum, already referred to in these columns, the Chief Medical Officer of the Ministry of Health emphasized the value of the information contained in the annual statistical review of the Registrar-General for England and Wales, and directed the attention of medical officers to the reduced price at which sections of this publication will be available in future. The cost of the "Tables, Part I—Medical," is 7s. 6d., and that of the text 2s. 6d.

MORTALITY DURING 1928

The first part of the review for 1928[1] is concerned with the deaths registered in England and Wales during that year, of *which 235,542 occurred among males and 224,847 among females*. The total of 460,389 corresponded to a crude rate of 11·7 per 1,000 of the estimated population, or, standardized to correct for the deviation of age and sex distribution, to 9·9—the lowest recorded in this country. Excluding the figures for 1921, 1923, and 1926 the number of deaths in 1928 was the lowest returned since 1862, when the death rate was more than twice as high.

It is noteworthy, however, that while the rate at all ages and for each sex was the lowest recorded, the mortality among males from all causes was higher than that of females by 25 per cent.—exceeding for the first time the percentage recorded in 1916–20. Among the chief causes of the higher male death rate were various types of cancer, accident (violence other than suicide and homicide), pneumonia, and arterio sclerosis. The proportionate excess from tuberculosis was the same as that from all causes. Some forms of mortality other than those associated with maternity were largely restricted to one sex—for example, general paralysis of the insane, peptic ulcer, and genito-urinary disease other than nephritis, as well as suicide and accident, being mainly confined to males, and cancer of the sex organs and diseases of the thyroid to females.

Infant Mortality

The rate of infant mortality in 1928 was 65 per 1,000 live births, which was exactly half of that of seventeen years earlier. Of the total number of deaths registered during the year, 9·3 per cent. were those of infants under the age of 1 year—a diminishing proportion in late years owing chiefly to the falling birth rate. For the second and third months jointly the 1928 rate was the same as that of the previous year, but at all other ages the rates recorded were the lowest attained in this country.

In each year *from 1911 onwards the highest rate has occurred* in the North county boroughs and the lowest—except in 1923—in the rural districts of the South. An unusual feature was that the London rate exceeded the general average by 4 per cent. This is attributed to the high mortality among infants aged 3 months and over, arising mainly from measles and respiratory disease. On the other hand, the continued low mortality in London of infants during the first four weeks of life—for the fourth successive year over 20 per cent. below that for the country at large—suggests that if the maternity conditions existing in London could be extended to the rest of the country this "neo-natal" mortality, which has fallen since 1911-15 by only 20 per cent. in England and Wales, might be reduced at once to the London level.

Illegitimate infants die immediately after birth at a much higher rate than legitimate, and the excess is evidently many times greater from violence and neglect than from any other cause. *Thus, the figures for 1928 indicate that the mortality* among the illegitimate caused by violence and lack of care was over ninety times as high during the first thirty minutes of life as that of legitimate infants, whereas for all other causes it was only about three times as high. Further, in 1928 the mortality among the illegitimate of both sexes on the first day of life appeared to be rapidly increasing coincident with a slight but steady decline in the mortality rate for the legitimate.

Compared with the preceding five years, the infant mortality in 1928 from all causes was less by 10 per cent. Marked declines are noted in the mortality rates from bronchitis and pneumonia, attributable to progress in infant hygiene and favourable weather conditions. The rate for the two diseases jointly—namely, 13·17—was unprecedented. Fewer deaths also occurred from congenital debility and convulsions.

Infectious Diseases

An extensive outbreak of enteric fever took place in London during July and August of 1928. Although the total number of cases recorded in London during the year—595—represented an increase of 85 per cent. over the number of the previous year, the average mortality figure was not exceeded. Notably low mortality rates from this disease were also general throughout the South of England, on the whole, the rate for the South was much lower than that of the Midlands or the North. From a survey of recent years the distribution appears *to be definitely changing from urban to rural areas*. The opposite tendency is recorded in the mortality rate from measles, which continued to be associated with city life. Deaths from this cause numbered 4,302, corresponding to a mortality of 109 per million of population. Small-pox was prevalent in certain coal-mining counties, and although the type was comparatively mild, the number of deaths exceeded that of any other year since 1905.

The fatality rate for scarlet fever was about the same as that of the previous year, the mortality being less than 2 per cent. of that recorded sixty years earlier. Whooping-cough among children yielded a death rate lower by one-third than the rate at the beginning of the century. Statistics for diphtheria and croup at ages under 15 indicate that the mortality rate was higher than in any of the five preceding years but lower than in any year before 1923.

The number of deaths assigned to influenza was 7,754—4,084 of males and 3,670 of females—representing the lowest mortality rates since 1914. For the fifth year in succession the lowest death rate was recorded in London—illustrating a definite gradation of mortality, at a maximum in rural districts and a minimum in large towns. It is suggested that the term "influenza" may be more widely interpreted in rural than urban practice. Of the deaths in 1928, 45 per cent. were associated with pneumonic and 19 per cent. with other pulmonary complications. Notifications of encephalitis lethargica were the fewest since 1923, and the mortality the lowest since that date. Fewer cases, proportionately, were diagnosed in London than elsewhere, and the ratio of deaths to notified cases was smaller than in any other section of the population.

The standardized death rate for tuberculosis fell from 952 per million in 1927 to 909, the death rate for both sexes being the lowest recorded. Females aged 15 to 25 formed the only part of the population in which tuberculosis mortality had not materially declined. The number of deaths ascribed to syphilis—namely, 1,532—was the largest since 1921, though the increase can be partly explained by the introduction of the new form of medical certificate in the middle of the previous year. The mortality in early childhood from this disease continued to fall at a diminishing rate.

Cancer

Deaths ascribed to cancer during 1928 totalled 56,253—26,013 of males and 30,240 of females. For both sexes these figures were the highest returned. The number of deaths from carcinoma was the largest, and that from undefined cancer the smallest, since the record of this distinction was made in 1901. Proportionately, the mortality from sarcoma, compared with the rate for carcinoma, has been decreasing, the ratio of 49 per 1,000 total causes in 1928 being the lowest on record. The standardized death rate for males amounted to 1,032 per million and that for females to 1,000. Both these rate were higher than for any previous year. While the mortality was higher among males for the preceding five years, the number of deaths and the crude death rate remained appreciably higher for females owing to the greater average age of the female population. The features of distribution by sex and age were much the same in 1928 as in the previous year but the London rate for the first time was lower than that for the county boroughs.

[1] *The Registrar-General's Statistical Review of England and Wales for the Year 1928* (New Annual Series No. 8.) H.M. Stationery Office. 1930. 5s. net.

Diabetes Pernicious Anaemia

Mortality rates for diabetes—91 for males and 101 for females—were higher than in the previous year The rate for males was the highest since 1922 (101) and that for females since 1915 (104) Since the introduction of insulin the mortality among males under the age of 55 had been reduced up to 1923 by 37 per cent and that of females by 21 per cent At 25 to 45 years the rate for males had fallen by 45 per cent. The effect of this large reduction, however was masked in the total death rate by the concurrent increase of mortality at ages over 55 No indication is given by the death returns that insulin had had any effect in reducing the mortality in later life It would seem that as phthisis mortality decreases that from diabetes increases the latter being apparently a disease of prosperity and the former of adversity

Satisfactory improvement is recorded in the mortality rates from pernicious anaemia, presumably as the result of the new liver treatment introduced in the later part of 1927 The standardized rates for males fell from 44–50 in 1921–27 to 30 in 1928 and that for females from 54–61 to 39 The number of deaths from pernicious anaemia however was proportionately higher than from all causes jointly at the ages of 45 to 75 in each sex from the ages of 55 to 65 the excess was 110 per cent for females and 72 for males Owing mainly to more frequent certification of degenerative conditions the mortality from heart disease was higher than in the previous year Standardized death rates for diseases of the respiratory system were the lowest on recent record at all ages and for both sexes

Deaths ascribed to pregnancy or childbirth numbered 2 920, corresponding to a rate of 4 42 per 1,000 live births Including associated mortality the proportion was 5 62 As in the preceding year a notable feature was the low mortality in London from septic and other causes The rate for Wales during 1919–28 was uniformly above the average for England and Wales to an extent varying from 19 to 43 per cent

The 656 deaths under or connected with the administration of anaesthetics exceeded the number for 1927 by 60 and was more than double that of any year prior to 1916 Of the total, 102 were associated with cancer and 38 with hernia

POPULATION

At June 30th 1928 the total population of England and Wales was estimated to be 18 826 000 males and 20 526 000 females The population was assumed to have grown by 4 2 per cent over the period since 1921 representing an arithmetical average increase of 0 60 per cent per annum compared with 0 49 per cent per annum during the decade 1911–21. The sex inequality, expressed as 1 096 females per 1 000 males in 1921 was reduced to 1 089 females per 1 000 males in 1928 According to the estimated age distribution the average ages of the mid 1928 population was 31 1 and 32 7 for males and females respectively, compared with averages of 29 9 and 31 2 at the last census. The live births registered in 1928 numbered 660,267, corresponding to a birth rate of 16 7 per 1 000 of population This slight increase is regarded as a reaction from the more than usually depressed rate of last year and of no permanent significance The proportion of male to female births was 1 044 1 041 and 1 044 to 1 000 for legitimate illegitimate and total births respectively Live births exceeded deaths by 199 878 compared with 169 563 in 1927 this rise in the natural increase figure is attributed mainly to the fall in the death rate during a period in which the regular fall in the birth rate was temporarily interrupted The birth rate *in this country attained* its highest value during 1865–1880 when it exceeded 35 per 1 000 population from that time it diminished by gradual and almost continuous stages to 23 8 in 1914 The rate of natural increase—4 3 per 1 000 of population in 1927 and 5 0 in 1928—was lower than that of any earlier recorded periods with the exception of the war years. It may be inferred from a study of the series that even if the fall in the birth rate continues the number of births will exceed the number of deaths for some years and that apart from the results of migration, the population will go on increasing though at a somewhat slower pace Mere excess of births over deaths however does not imply that the perpetuation of current conditions of fertility and mortality would be sufficient to ensure a continuous increase in the national population both now and in the remote future.

MOTOR DRIVERS AND VISION

BY

N BISHOP HARMAN, M A, M B, F R C S

On November 13th Mr Herbert Morrison, Minister of Transport, announced that it is proposed to bring Part I of the Road Traffic Act, with the exception of certain small sections, into force on December 1st The Regulations to be put into force on this date that will most concern the private owner are those affecting the issue of licences to drive The new form of application for a driving licence contains a declaration as to the physical fitness of the applicant * Three specific questions have to be answered The second of these reads

> Are you able to read at a distance of 25 yards, in good daylight (with glasses if worn) a motor car number plate containing six letters and figures?

An applicant who replies "No" to this question is debarred from obtaining a licence

It is evident that the prospective driver may take advantage of the best of the conditions offered He will choose a clean, clear number plate, and preferably one with the letters painted white on a black ground and not one with polished metal letters and figures which give disturbing reflections He will choose good daylight and neither the glare of sunshine nor the dimness of the dusk He will use glasses if they help him If he can read these letters at the required distance and fulfils the other conditions, he may drive Since nothing is said about 'eyes" there is no ban upon the one-eyed man

The letters and figures of a motor car number plate are prescribed in the Statutory Rules and Orders, 1930, No 277, Fourth Schedule, paragraph No 4

> All letters and figures must be three and a half inches high every part of every letter must be five-eighths of an inch broad and the total width of the space taken by every letter or figure except in the case of the figure 1 must be two and a half inches

The prescribed size is practically that of the usual top letter of a Snellen's test card marked D 60 It is the letter which the person with 'normal' vision will read at 60 metres Since the candidate for a driving licence is only required to read at the distance of 25 yards the letters which the "normal sighted read at 60 metres or 65 616 yards (taking the metre as 39 37 inches), the requirement of the Regulations cannot be held to err on the side of severity

Vision satisfactory for driving safely is compounded of many factors So far as acuity is concerned it implies the ability of the driver to recognize objects in the street and to recognize their detail distinctly enough to be able to judge signs of movement One of the best comments on the necessity for good visual acuity I have heard was put thus A distinguished public servant said When I drive I am not content to be able to see a child on the roadside I wish to be able to see the position of the child's limbs and the expression of his face so that I may judge of his probable movements, and drive accordingly"

Prospective drivers who find they cannot see the letters at the required distance will probably apply to ophthalmic surgeons for advice It is with the examination of the sight of such applicants in the consulting room that I propose to deal We shall need to make out subjective tests upon Snellen's test cards It would be inconvenient to make them in the open street

Tests of Visual Acuity

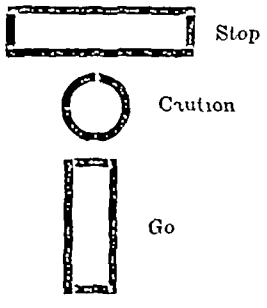
Ophthalmologists are in the habit of recording the visual acuity of a person examined in the form of a vulgar fraction—a convenient but misleading practice A person reading the letters of a number plate of a car at 60 metres would be recorded as having 60/60 vision for he reads the 60 metre line at 60 metres This is equivalent to our common standard of 6/6 when the vision is taken at the convenient consulting room distance of 6 metre Recording the visual requirement of the Regulations in the same form the ability to read at 25 yards the letters which those with normal visual acuity can read at 65 616 yards would be 25/65 6 If these figures of distances in yards be

* See *British Medical Journal* November 22nd, 1930 p 834.

converted into metres according to Snellen's scale, the acuity would read 6/15 74 That is an acuity nearly midway between the common 6/18 and 6/12 I know of no test cards with a line of letters or figures of either 6/16 or 6/15 upon them, but it would not be difficult to construct such lines The letters required would measure 22 7 mm in height, as compared with 6/18 of 26 mm and 6/12 of 17 5 If the surgeon has not provided himself with such lines of letters he can get an approximately equal measure by requiring his patient to read 6/18 promptly and correctly, and at least half the letters shown in 6/12 lines

Muscle Balance and Light Sense

When a patient consults an ophthalmic surgeon on the state of his vision and its sufficiency for driving, it is certain that the surgeon should not confine his examination to visual acuity, though that only is recognized by the Regulations The patient's muscle balance, his light sense, and the effect of the form of the lenses needed to obtain good acuity will come into consideration, and to some extent colour vision also



Defect of muscle balance likely to cause diplopia in states of fatigue will require caution In lower degrees of defect the driver will not be likely to be unsafe, but he should be cautioned against lengthy drives, or driving when not in good health In higher degrees of defect with frequent symptoms of diplopia there will be added risks, unless the defect can be satisfactorily corrected, or the driver learns to drive with one eye only It is certain that a driver with diplopia should not drive with both eyes open Most people with this defect are wise enough not to attempt to drive

A good field of vision is of the highest importance, not only to the driver, but for all forms of locomotion A loss of 20 to 30 degrees of the peripheral field renders the subject liable to bump against foot passengers as he walks abroad, and he is certainly unsafe to drive I have never found a patient with this defect who did not recognize his disability for driving

Light sense is of importance in night driving, and in this connexion it is convenient to consider the effect of the form of lenses required to give good visual acuity Myopes, especially those with high degrees of defect, are conscious of their poor vision in the dusk The form of their lenses disperses the rays of light and reduces the light received by the eyes The deficiency, both for the myopes and for those whose defective light sense is purely retinal, can be recognized by the use of the perimeter If the peripheral field be mapped out in good daylight, and then again after the adjustment of the window blinds, so as to reduce the illumination to one-tenth of the full light, the reduction of the field of vision will be evident and demonstrate the risks of the disability Subjects of these defects will be safe drivers in the daytime, but at night they may be dangerous Mostly they recognize the defect and avoid night driving

Traffic Signals and Colour Vision

Defects of colour vision should not constitute any disability for driving either by day or by night But the growing practice among local authorities of placing coloured signal lamps at road crossings has introduced a real difficulty for the colour-blind Signal lamps of red, yellow, green, and white are springing up everywhere A mistake in reading one of these signals may bring the colour-blind driver into conflict with the police, and possibly into collision with other drivers or pedestrians There is no excuse for the lack of thought displayed in the design of these new road signs It would be just as easy for the authorities to make the signals recognizable by shape as by colour They need three signs, for "Stop," "Caution," "Go" If these signs were arranged upon a uniform plan, with a horizontal bar of light for "Stop," a circular light for "Caution," and a vertical bar of light for "Go" they would be more easily recognized by all

The lights might be coloured, or not, as the authorities thought pleasing, but the shape would be the determining character

The advice we may think well to give to our patients upon the state of their eyes and vision apart from the degree of visual acuity, and their ability to pass the standard set by the Regulations, is outside the scope of this note But my experience leads me to believe that advice given in the patients' interests will be well received. Intelligent patients are anxious neither to endanger their own lives nor the lives of others by taking risks that conditions prevent them from controlling

PUBLIC HEALTH CONGRESS

Sir Arthur Newsholme and the Insurance Medical Service

At the first of the sessions of the Public Health Congress, held at the Royal Agricultural Hall, London, from November 17th to 22nd, an address was given by Sir Arthur Newsholme (formerly Principal Medical Officer to the Local Government Board) on the subject of "Medicine and the State"

Sir Arthur Newsholme covered a wide range of discussion in reviewing public health medical activities, and laid down certain generally accepted postulates concerning medical services needed for the mass of the population, but subsequent speakers almost entirely concentrated on his criticisms of the insurance medical service In speaking of voluntary hospitals, he said that, unhappily, in many areas these continued to treat out-patients for whom there was ample medical provision by panel doctors He also stressed the abuse of out-patients by the voluntary hospitals "The vast economic loss of working hours for men and of domestic work for women implied in present conditions would, if capitalized, pay—as is most desirable—salaries to an increased staff of junior hospital physicians and surgeons, who would then be honourably bound to attend at stated hours, and for whose patients an appointment system could be arranged, which would prevent the perfunctory and hasty work now too common" Speaking with regard to tuberculosis dispensaries, he considered that in so far as clinical work was done there, responsibility should ultimately revert to medical practitioners in family practice It had been an unfortunate result of the panel system as now operating in this country that private individual medical responsibility had been too readily abandoned One postulate which Sir Arthur Newsholme laid down was that it was dishonest to assume or continue responsibility for the treatment of a patient unless one had sought to obtain accurate knowledge, determined by detailed examination of his physiological systems, of the patient's fundamental conditions of health This applied to some panel and other private medical practitioners, as well as to much dispensary work, and he thought it should be a condition of receiving an insured person on his list that the doctor should act in accordance with this postulate, besides acquainting himself with the occupational or other risks of his client's life If this condition of honest medical practice were met it would lift the panel practice of a large minority of the medical profession out of "its present quagmire of dangerous superficiality Incidentally, it ought to go far to reduce the present extravagant prescription of unnecessary drugs, for a doctor's prescription is often a mere placebo, covering sometimes an incomplete diagnosis, the completion of which was attainable, and covering perhaps oftener the waiting and watching period before a diagnosis is practicable"

The speaker dealt severely with the conditions of insurance medical practice in this country The fact that the Insurance Act had become a permanent part of social machinery, notwithstanding its many flaws and especially its "propping up an already obsolete type of medical practice," was remarkable testimony to the genius of the civil servants who made it workable though at an expense entirely disproportionate to the benefits received The defects on the medical side were obvious, the most serious of them was the absence of consultative services, the usual failure to provide hospital treatment when needed and

the non inclusion of dependants "There is the further essential defect in the British system that no panel doctor is required or expected to treat any of his patients with skill which is beyond the average medical skill of a general practitioner. In our medical insurance system in this country we have doctors incompetent to give the average care for which they are paid, and we have very many others who discover conditions requiring medical care in their panel patients, with which their medical skill is quite competent to cope, but which they may refuse to treat within the terms of their contract of service." With regard to the burning question of medical certification Sir Arthur Newsholme continued in these terms: "This [the giving of a certificate of inability which meant a cheque to be paid by the approved society] has meant the moral degradation of individual doctors who have certified without thorough examination of a patient, and without realizing their responsibility not to certify merely because the patient desires it. Such cases I am confident, are very exceptional, but borderline cases are numerous, and in such cases the doctor desires to give his patient the benefit of the doubt. How can this sinister association of medicine and money be avoided, or if it is inevitable, how can the weakness of a doctor wilful to please his patient, and the unscrupulous or unthinking desire of the patient to have a rest from work even when he is not incapacitated, be counteracted?" He doubted whether an effective remedy for over-certification was practicable unless sickness insurance societies were regionalized and placed, in many respects at least under county and county borough administration. He concluded with the remark that the success of the contract medical work of sickness insurance was primarily a question of character, preponderantly the character of the insured, but also the character of the panel doctor.

Dr H. B. Brackenbury took up Sir Arthur Newsholme's criticisms on three points. It had become a commonplace, he said, especially for lay people, to ridicule the "bottle of medicine." He could assure any who were sceptical about the matter that he could give them a bottle of medicine, the efficacy of which in a very short time they would not be disposed to dispute at all. There were very many drugs which were of the highest value in the practice of medicine and without which the lives of patients would be very much less comfortable. He protested against the reiteration of this disparagement of the use of drugs which never failed to produce a titter. There were many other ways of treating disease than the use of drugs, but drugs remained a very important part of the science and practice of medicine. Numbers of drugs were specific in the treatment of disease and others led to the amelioration of distressing conditions. In the next place he complained of Sir Arthur Newsholme's reference to "the average medical skill of a general practitioner." The word "average" nowhere occurred either in the Insurance Acts or regulations or the terms of service under which the doctor acted. There was a definition of the scope of the treatment which an insured person was entitled to have under his contract, and that scope was set out as everything which he could expect in the way of medical treatment which did not involve special skill of a kind which general practitioners as a class could not reasonably be expected to possess. There was nothing about the "average" skill of a doctor to which certain doctors did not live up. That was a very serious misunderstanding in this connexion. He also complained of an implication in the address that the work of the insurance practitioner was almost necessarily superficial.

Sir Arthur Newsholme intervened to point out that his reference to the too ready abandonment of individual medical responsibility related solely to tuberculosis.

Dr Brackenbury went on to criticize the words "its present quagmire of dangerous superficiality." He did not understand one of these references, nor did he understand the remark about "propping up an already obsolete type of medical practice." Quite candidly, he had no idea what that meant. There was a general suggestion in the address that a very large number if not the majority of insurance practitioners did not in fact take a thorough interest in their insured patients, and were very liable not to make a complete examination of the patient's condition. These things he repudiated with great emphasis. A comparison between insurance practice and medical practice in general would, in his experience, be favourable to the former. There were all sorts of things in medical practice which they wished were not there, but if the average attention and results obtained in insurance practice were compared with like things in everyday private practice, it would be found that the insurance patient had by no means the worse of it. Moreover, the contractual relationship between the insurance practitioner and the insurance patient was exactly the same *qua* doctor and patient as between a private practitioner and a private patient. (Cries of "No.") Indeed in one respect, the insurance patient had an advantage, because if he, as a private doctor, were asked to attend a private patient he was at liberty to stay at home and decline to go, whereas if he were called to an insurance patient he had no option but to go.

Dr Graham Little, M.P., deprecated on the ground of economy the proposals to extend the national health insurance services, and pointed to the recent great achievements of the voluntary hospitals, without whose help he said, the National Health Insurance Act would have foundered long ago in hopeless chaos. The insured population could count upon that resort to get the treatment which the National Health Insurance Act had not provided for them.

Dr Alfred Cox protested that Dr Graham Little appeared to complain because the insurance system did not give something that it never pretended to give. When Mr Lloyd George came to the British Medical Association in 1911 and was told that his system was not complete he replied, "I know it is not, but I believe in walking before you run. I am starting this system with the provision of the family doctor and you can build the other services up afterwards." The speaker also took up Sir Arthur Newsholme's point about out-patient departments. If these departments were used for accidents and emergencies and for a second opinion in cases where such opinion was needed as well as for giving such specialist attention as could not be obtained elsewhere they would be doing very fine work. They did that but they did a good deal more which was a pure waste of money. Every hospital liked to talk about the great increase in out-patients, but this was very largely due to a class of patients who could perfectly well get their attendance elsewhere and ought to be told to go elsewhere. There was every day at these out-patient departments a constant queue of people who went there simply to get attention for chronic diseases. To reform the out-patient department would be a practical step which might be undertaken very quickly; it would result in the saving of the time of the staff and the money of subscribers, without injuring anybody.

Sir Arthur Newsholme, with regard to Dr Brackenbury's comments, said that he had a warm admiration for him as a medical statesman who had done great things for his profession. On this occasion Dr Brackenbury had departed to some extent from a statesmanlike attitude. He must have regarded him (Sir Arthur Newsholme) as suspect to begin with, and have then read portions of sentences which fitted in with his suspicions. He agreed with what he had said about the bottle of medicine and that medical practice could not get on at all without drugs; even placebos were sometimes necessary for the mental health of the patient. But there was a large mass of unnecessary drug giving in insurance practice. With regard to the point about average skill he had listened to Dr Brackenbury's explanation but it appeared to him to be the difference between tweedledum and tweedledee; they were mere verbal points. There remained the fact that a large number of practitioners did not give all the treatment to their patients which they were quite competent to give simply because they were above the average. By "propping up an obsolete type of medical practice" he meant over-medication by drugs, symptomatic treatment, lack of hygienic advice and too little prevention. Mr Lloyd George had said that national insurance must walk before it could run, to which his reply would be that all it had been doing up to the present had been "hopping around."

Sterilization of the Unfit

An interesting though inconclusive discussion took place at the congress on the subject of the sterilization of the unfit The chair was taken by Mr WALTER HEDLEY, K C, Recorder of Newcastle-on-Tyne Dr C P BLACKER put forward the view of the Eugenics Society, which, he said, did not propose the sterilization of large numbers, nor did it regard sterilization as anything but an auxiliary and additional measure to segregation The safeguards his society proposed included consent of the person (when this could be given), consent of the spouse (if any), consent of the parent or guardian, and consent of the Board of Control The Board took a very cautious attitude to the matter, and that in itself was a great safeguard It was argued that not enough was known about the inheritance of defect to legalize sterilization, but the Board had advocated forbidding the marriage of defectives If enough was known to forbid marriage, enough was known to legalize sterilization It had been held that sterilization would lead to promiscuity and venereal disease, but to forbid marriage was more likely to have this effect, because that was to dam up two instincts the sexual, and the desire for a stable home Sterilization merely prevented parenthood, and was far less likely to remove any bar to promiscuity in a defective than in a normal person fully aware of the consequences of his acts

DR W F MENZIES, speaking for the Royal Medico-Psychological Association, said that that body would have nothing to do with sterilization in mental hospitals, though it agreed that there was something to be said for its application to suitable cases of mental defect under proper safeguards DR A F TREDGOLD, for the Central Association of Mental Welfare, considered that quite a strong case could be made out for sterilization of patients of mental hospitals, who had intermissions during which they carried on normal life, and begot children For mental defectives he thought segregation was indicated, these people could not compete in the normal world, and any contribution they made to their upkeep must be made under sheltered conditions, and therefore they should be segregated He pleaded for an impartial investigation by a Royal Commission before anything far-reaching was decided DR W A POTTS said that he was in favour of sterilization under proper safeguards, but he pointed out that talk about sterilization was being made the excuse by backward local authorities for not getting on with their proper duty of ascertainment and providing colonies for mental defectives

Some lay persons, including a member of the Mental Hospitals Association, spoke strongly in favour of sterilization and a learned Jesuit equally decidedly against

The School Medical Service

SIR CHARLES TREVELYAN, President of the Board of Education, addressed the congress He said that even when all the common and obvious defects of childhood had been adequately dealt with in the schools, the school health service would by no means have reached its full development There must be extension of the treatment of delicate children in open-air schools and by artificial light, further measures must be taken to counteract crippling conditions, and the health of children under school age must be protected in nursery schools and by a regular system of medical examination Local authorities had begun to realize the importance of training in the principles of health, and the reorganization of the elementary schools offered a great opportunity for the definite inclusion of that subject in the school curriculum

A paper on the school medical service was read by DR W M ASH, county medical officer of health and school medical officer for Derbyshire Responsibility, the medical service had led to a vast improvement in the cleanliness and clothing of the children Education in healthy habits and hygienic principles was just as important as the teaching of arithmetic In the discussion which followed, R H CROWLEY, of the Board of Education, stressed the need for [illegible] care of children under 5, and of [illegible]

Voluntary Hospitals and the State

The Incorporated Association of Hospital Officers arranged a discussion on the question of co-operation between voluntary and council hospitals In an opening paper MR A H LEANEY, house governor of the Birmingham General Hospital, asked whether it was desirable and practicable that there should be effectual co-operation between the voluntary hospitals, with their long tradition of unpaid medical service and a "personal" note in the care of the sick, and the municipal hospitals served mainly by salaried and full-time medical men He thought the difference between the two classes of hospitals superficial, now that most of the patients in voluntary hospitals paid towards treatment and maintenance, and the custom of paying medical staffs was beginning to creep in Moreover, the voluntary hospitals were no longer the only schools of training for doctors and nurses, since mental disease, tuberculosis, and infectious diseases were treated in municipal hospitals The voluntary hospital system was open to a certain amount of criticism, particularly in regard to the out-patient departments, and the regrettably long period during which critical cases were often kept waiting for admission to the wards He thought the voluntary hospitals should invite the representatives of public hospitals to meet them in consultation as to the best means of improving on the present wasteful and unsatisfactory dual system

A discussion ensued in which many members of local authorities and hospital boards took part Some advocated amalgamation rather than mere co-operation, saying that the present voluntary system was spasmodic, intermittent, and inadequate A representative from Chester pointed out that the association of voluntary and council hospitals would work differently in different areas In some towns the voluntary hospital would continue to do the highly skilled surgical work, the municipal hospital not being so well provided The voluntary hospitals had their defenders in the discussion, which was wound up by SIR JAMES MICHELL of the Seamen's Hospital, Greenwich, who declared that the voluntary hospital would always attract to itself the most able and brilliant men and women of the medical profession

Maternal Mortality

PROFESSOR EDWARD MELLANBY, at one session of the congress, gave an address on maternal mortality He described the investigation which he had made, with Dr H N Green, through the help of the Medical Research Council, on the cause of the diminished resistance to infection at the time of childbirth For many years he had been interested in the effects of diet in raising and lowering the resistance of animals to infection, and, following upon animal experiments which showed that the addition to the diet of a sufficient quantity of vitamin A prevented the development of septic foci, he had had the opportunity of using vitamin A as a therapeutic agent in certain cases of puerperal septicaemia, and also of giving it prophylactically in the ante-natal department of the Jessop Hospital, Sheffield The cases were too few to establish complete proof of the anti-infective action of vitamin A in puerperal sepsis, but so far as they went they were definitely in favour of this action and bore out the experimental work "I would far rather believe," said Professor Mellanby in conclusion, "that the reason for the fact that whereas the maternal mortality in England is 5 to 5 8, and that of France is only 2 5 and Italy 2 8, is not that doctors and midwives in England are less skilful than those of France and Italy, but that the French and Italians have a better appreciation of the protective value of vegetables, and probably of dairy products, than the English"

Reasons of space permit no more than a mention of other papers and addresses The subjects dealt with included physical education in the new senior schools, the value of the open space in modern social economy, practical aspects of the mental health problem (a subject introduced by Dr T Beaton), the social problem of mental deficiency (brought forward by Dr E S Littlejohn), industrial psychology in relation to public health, and various aspects of sanitary engineering

British Medical Journal.

SATURDAY NOVEMBER 29TH, 1930

CARDIO-VASCULAR SYPHILIS

Syphilis has not always been recognized as a grim figure among the etiological factors in heart disease In fact, the existence of syphilitic disorders of the heart gained no general recognition until Ricord gave his description of gummatous myocarditis eighty years ago The last decade of the nineteenth century saw, especially in France a fresh access of interest in this subject, while the discovery a few years later by Schaudinn of the *Spirochaeta pallida*, and by Bordet and Wassermann of the complement-fixation test provided new implements for the use of the clinician and the pathologist But even with the increasing knowledge of cardio vascular syphilis, attention has been almost exclusively focused upon the aorta, the aortic valves and the coronary orifices until the last ten or twelve years In 1918 Warthin[1] put forward the view that gummatous changes were not valid criteria of the presence of myocardial syphilis and that damage to the heart musele was commonly represented by a mild, diffuse, inflammatory change Since then, interest has been directed to the possibility of differentiating such changes from those attendant upon gradual ischaemic necrosis

With these divergent and often controversial matters assuming an ever increasing importance in medical literature on both sides of the Atlantic, it is valuable to know the mature views of an authority on this subject Elsewhere in this issue (at page 893) will be found an admirable summary by Dr Carey Coombs, of the pathological clinical, and therapeutic problems presented by cardio vascular syphilis In their latency their frequent coexistence in the same individual, and their lymphatic origin Dr Coombs draws a close analogy between tabes and cardio vascular syphilis He considers the latter in terms of aortitis and looks upon the initial pathological process as an inflammatory tide breaking upon the aorta, the brunt of damage falling upon the supravalvular part of the aorta, the valves their commissural attachments, and the orifices of the coronary vessels Even apart from the burden laid upon the heart by aortic incompetence the medial damage and consequent loss of the elastic recoil in the aorta must seriously impair the peripheral circulation Although the blood supply to the myocardium is often reduced in cardio vascular syphilis this is brought about nearly always by constriction of the coronary orifices That these arteries are but rarely involved in their course by a syphilitic process is shown by the infrequency of myocardial infarction due to syphilis Levine found that less than 5 per cent of patients suffering from coronary thrombosis had a positive Wassermann reaction and even in such patients the arterial disease was not necessarily attributable to syphilis

Recalling the increased incidence of syphilitic infection in the years during and after the war Dr Coombs comments on the possibility of large numbers of cases of cardio vascular disease appearing in the forthcoming decade when the usual latent period of fifteen to twenty years has elapsed Clearly the occurrence of such an increased incidence will suggest that the adoption of more widespread and intense antisyphilitic treatment has been without avail at the same time it will impress upon the medical profession and particularly the general practitioner, the necessity for early diagnosis For even if there has been no antisyphilitic treatment or if this has been unsuccessful in preventing cardio vascular involvement appropriate treatment may even at so late a stage delay the inevitable fatal outcome Since the usual initial lesion is an aortitis it becomes necessary to recognize this condition The author comments upon two important points in the symptomatology of the disease at this stage while breathlessness with effort is a common complaint, bouts of nocturnal dyspnoea are not infrequent further the precordial pain which the patient experiences appears definitely to be of cardiac origin, and yet may be unrelated to effort Two other important manifestations of aortitis are the presence of an accentuated aortic second sound in conjunction with a normal or low blood pressure and obliteration of the normal resonance over the upper half of the sternum While the disease is at this stage the x ray may or may not show a dilatation of the aorta Summarizing the points in radiological diagnosis Steel[3] states that syphilitic aortitis can be suspected under the following conditions first when a diffuse dilatation of the aorta, often with hazy borders is associated with a heart shadow of normal size secondly when a dense high, aortic shadow is found in a young individual without previous hypertension, and thirdly when localized dilatation associated with localized increased pulsation is demonstrable

In the early days of the arsenical treatment of syphilis the striking results achieved in many cases of secondary syphilis led to the free administration of these preparations to cardio vascular syphilitics Unfortunately it led also in the hands of many clinicians to a crop of sudden deaths at the time of injection or within forty eight hours A further and later ill effect that has at times been attributable to too intensive use of arsenic is that resulting from the rapid resolution of syphilitic inflammatory tissue that may follow When this occurs the general condition of the patient improves remarkably but an accentuation of the original cardiac defect simultaneously sets in—the therapeutic paradox of Wile Because of these unfortunate effects the arsenical preparations fell into disuse for syphilitic heart disease the old fashioned iodide and mercury taking their place At the present time opinion remains divided on this point some assert that the risks are not justified when cure is impossible and the likelihood of improvement remains questionable others (and these are rapidly becoming the majority) believe that the risks are slight provided small doses are given at relatively long intervals Dr Coombs recommends doses of 0·3 gram of novarsenobenzol at weekly intervals

A contribution to our knowledge of the value of arsenical treatment in aneurysm and syphilitic aortic incompetence has recently been published by Moore and Danglade[4] They found that in a group of patients suffering from aortic aneurysm the duration of life from the onset of symptoms averaged nine months in untreated patients while in those adequately treated there was a prolongation of life to an average of nearly six years Similar results were observed in a group of patients suffering from syphilitic aortic incompetence Two therapeutic principles emerge from the foregoing considerations of treatment first as Dr Carey Coombs points out the

importance of adequate antisyphilitic treatment in the early stages of the infection, and, secondly, a careful administration of novarsenobenzol after previous courses of iodide and mercury, in patients suffering from cardio-vascular syphilis These measures offer the best hopes of averting or delaying the too frequent disasters overtaking syphilitics in middle life

CITY NOISE

When, in 1928 and 1929, the press was calling for measures to mitigate the noise nuisance, and the British Medical Association, which had been largely responsible for the public interest in the subject, was formulating proposals to secure this end and bringing them to the attention of the Government departments concerned, it seemed that here, perhaps, was a campaign that would not end till its objectives had been gained The agitation in the newspapers has died down, the Association and the other important public bodies who interested themselves in the subject have passed to other business, the Government has tinkered with one or two of the worst acoustic outrages, but the hooting and rattling, the hubbub and clatter, go on exactly as before That there was some danger of this happening was predicted in these columns two years ago, when the campaign against noise was at its height[1] "The price of freedom from noise," we said then, "is eternal vigilance" But eternal vigilance is just the price that the public is not prepared to pay—at any rate for what must seem to it, judging from its own contributions to the general pandemonium, as but a doubtful blessing Fortunately for those who serve the public, they are not concerned with giving it what it wants, but with finding out what the public ought to want, and striving to secure that, and in this exposition of the technique of democracy rests the justification for continuing a propaganda in which the public has betrayed but a fickle interest

They order, it seems, these matters better in the United States In the most populous city of that country the public health authorities have not only investigated with immense thoroughness the problems created by urban noise, but by the press and the radio, by poster and pamphlet and by every other available means of publicity, they impel the masses, on whose behalf they are working, to be interested in and to approve what is being done on their behalf A report[2] lately published by the Noise Abatement Commission of the Department of Health, New York, is a model of what such a document should be In language that all may read and understand, and with a wealth of illustrations, including photographs, charts, cartoons and simple graphs, it explains to the American public not only the conclusions that have been arrived at by the body of physicians, neurologists, otologists, lawyers, physicists, and engineers of which the Commission is composed, but how, by its own efforts, the public can contribute to the elimination of this unpleasant and even dangerous by-product of our machine age For details of the method which the Commission finally adopted for measuring the intensity of noise, by reference to an arbitrarily chosen unit, the report itself must be consulted, here it may be said that in the absence of such a method the precise survey of New York street noises that the Commission has carried out would have been impossible, and no reference points would have been available in terms of which the efficacy of measures designed to secure noise abatement could be accurately estimated But the Commission's conclusions about the effect of noise on human beings accord so closely with those expressed in the British Medical Association's Memorandum on Noise submitted on October 23rd, 1928, to the Ministry of Health,* that they are worth stating in full The Commission found that (1) hearing is apt to be impaired in those exposed to constant loud noises, (2) noise interferes seriously with the efficiency of the worker, it lessens attention and makes concentration upon any task difficult, (3) in the attempt to overcome the effect of noise, great strain is put upon the nervous system, leading to neurasthenic and psychasthenic states, and necessitating frequent recuperation in the country to maintain mental efficiency and alertness, (4) noise interferes seriously with sleep, even though in some cases it appears that the system is able to adjust itself so that wakefulness does not result, (5) it is well established that, over and above these other evil effects, the normal development of infants and young children is hindered by constant loud noises

This is not the place to describe the proposals of the Commission for restraining the hubbub it has analysed and measured—the noises of horns, sirens, open exhausts, defective engines, pneumatic drills, loud speakers, barking dogs, late parties, and a hundred other sources of disturbance which it has made the subject of its painstaking investigation Here we would only say that most of these proposals are as applicable to our own country as they are to the United States, and that not only the American public, but the public of every country that is now grappling with the noise problem, is indebted to the New York Commission for the most comprehensive study of the matter that has yet been made

SCIENCE MEDALS

A supplement to the issue of *Nature* for November 15th describes the science medals given by learned societies in Great Britain, Ireland, and the Dominions The awards are classified under three main headings general, the physical and mathematical sciences, and the biological sciences, including geology and geography In each case an account is given of the terms of the trust or foundation under which the medal is allotted Scientific achievement in this country is recognized by the award of a medal rather than by a monetary prize, and the tendency is to establish fellowships and post-graduate endowments to provide opportunities for definite research In a brief introductory essay on the art of the medallist it is justly observed that a beautiful design in bronze or silver is more desirable than a mediocre pattern in gold There is no doubt that the exquisite art of medalling has been neglected in this country, partly through ignorance and lack of support The artist in this medium must have a sense of the material and its special technique, a gift for adapting a decorative design to limited space and shape, and a penetrating divination of the achievement to be honoured In this country these essential qualifications are still imperfectly realized Since the revival of the art, which began about 1870, the French artist has been supreme in crystallizing and expressing his ideas, and the medal in France is almost universally esteemed Even there, however, the triumphs of Italian Renaissance masters, like Pisanello and Caradosso, have never been equalled The degeneration of the medal as a form of art, distinct from the coin on the one hand and the sculptured

medallion and bas relief on the other, is explicable only by an inquiry into the social and psychological conditions of the time It might form the subject of an instructive thesis For the modern science medal the artist is usually required to portray on the obverse side the lineaments of some person whose achievements are connected with the raison d etre of the foundation, the reverse being decorated by an appropriate design or device The reverses of most of the medals of earlier centuries drew their inspiration from Greek and Roman coins, and they assist the designer of the science medal in associating pagan derivatives with modern advances in knowledge Thus on the reverse of the Nobel gold medals awarded for physics and chemistry, Nature is personified as the goddess Isis The design, however, may be wholly pictorial The reverse of the gold medal struck in 1907 by the Royal Swedish Academy of Sciences to commemorate the two hundredth anniversary of the birth of Linnaeus depicts a student dissecting a flower Medals of satirical implication were in circulation at the end of the sixteenth and throughout the seventeenth century, and it is rather remarkable that science does not appear to have suffered from this form of abuse While many lampoons and caricatures were published deriding Jenner's discoveries, no satirical medal was issued According to the lists that follow the essay in *Nature*, almost a score of medals are awarded by medical societies alone in Great Britain, so that this "little art," which has been defined as the link between painting and sculpture, is not without encouragement

TRUTH AND SELF INTEREST

Mr Justice McCardie's observations on the spread of perjury have been so widely quoted in the daily newspapers that we need only draw attention here to some of the other parts of his Maudsley Lecture, delivered before the Royal Medico-Psychological Association in the Great Hall of the British Medical Association House on November 20th The announced subject of the lecture was Truth," which the judge defined very broadly as conformity to fact or reality He asked whether psychologists could offer any suggestions as to tests which might be applied by those whose duty it was to elicit the truth in legal proceedings or elsewhere The day had gone by when psychology was a mere aggregate of uncertain data, it was now more than a mere division of philosophy or branch of science it was a practical art Any psychologist who could formulate some means of ascertaining truth in evidence would be a benefactor to the cause of justice In what spirit should the search for truth be approached? Mr Justice McCardie indicated certain enemies of truth The spirit of enthusiasm was often such an enemy Lord Balfour once said truly that enthusiasm was a great thing, but it was a pity that so few enthusiasts could be trusted to speak the truth The psychology of enthusiasm still awaited the attention of expert students of human nature Truth had other enemies—namely, fear, self-interest and bias Lack of courage lay at the root of much that lowered the standard of public life Too many whispered to themselves the words of Voltaire "I am fond of truth, but not of martyrdom" Self-interest sapped the truth in innumerable directions With regard to every controversial utterance written or spoken the question should be asked, What (if any) self interest has the writer or speaker to serve? The history of bias, again, had yet to be written Here was a subtle and powerful enemy to truth with its tentacles spread in every direction Few realized the operation of bias in the great sphere of argument and opinion It worked surreptitiously, and produced effects beyond measurement or calculation How greatly a frank admission of partisanship would weaken the force of many arguments and create a corrective and beneficial mistrust among those who read or heard If partisanship were confessed, the danger would be known and often averted The judge then made the remarks on perjury which have had such wide publicity, adding, however, that a vast amount of incorrect testimony was given every day by the perfectly honest witness It was often assumed that the calm, self-restrained witness was giving truthful testimony, and the nervous, flurried witness false testimony Both these assumptions were untrue Murderers giving evidence on their own behalf in the witness-box usually gave it in a wholly dispassionate way, with singular ease of manner. Broadly, it might be said that the greater the criminal the more able and effective he was as a witness The habitual criminal was probably the best witness of all Nothing could exceed the skill, self-confidence, and audacious reliance on sex that was very often displayed by the intelligent female perjurer, and she had, as a rule, a histrionic sense not possessed by the ordinary man On the other hand, the judge gave two examples of perfectly truthful witnesses, both of whom cut a lamentable figure in the witness-box, and had a manner which would have made many people doubt their evidence The reason for their attitude in both cases was that they feared lest some question by cross-examining counsel, made in order to shake their credibility, should compel them to disclose something in their past life which had nothing whatever to do with the issue then being tried Mr Justice McCardie was proposing to omit the part of his lecture relating to the expert witness, but in response to requests from his audience not to leave this subject untouched he offered a few remarks The expert witness, he said, had been the subject of much criticism and denunciation Such a witness dealt primarily with questions of opinion So far as he asserted facts he stood on the same footing as the ordinary witness The conflict of opinion between expert witnesses was sometimes astounding but, of course it was a fact that experts differed outside as well as inside the courts Apart from the honest and almost unavoidable clash of opinion, there was a tendency sometimes a strong one for the expert in the witness-box to become a partisan and it was this tendency which led to the greater part of the invective often heard against the expert witness The subject of expert testimony' said Mr Justice McCardie is one of singular interest but I will only add and with pleasure, that in my view the quality of that testimony is steadily improving The explanation of this is to be found, not in any greater appreciation of the oath but in the ever-growing standard of integrity, fairness honour, and dignity among the honourable members of the great expert professions"

PAINTING AND THE HEALING ART

The eighth David Lloyd Roberts Lecture, under the auspices of the Royal College of Physicians and of the Medical Society of London, was given at the House of the latter by Mr William Rothenstein M A (Principal Royal College of Art, South Kensington) who spoke from the point of view of an artist on 'Painting and the healing art" Mr Rothenstein said that he found it difficult to believe, when he realized the extraordinary intellectual power of the mediaeval artists that mediaeval science had in it those elements of charlatanism of which so much had been made by the historian Looking at the culture of the Middle Ages it was not easy to imagine that scientific men especially healers, could have been so mixed up with astrology and the baser sciences as was commonly supposed It was probable that the same thing happened among scientific men as happened among artists in every age Just as anybody to-day, visiting a railway bookstall, would find it hard to believe from the literature exhibited

that this was the generation which had produced an Einstein, so probably in an earlier age the popular side of the healing art and of what was now called science in general was chiefly known to the people, while the finer and more serious elements then existing remained in the background, just as they did to-day, so far as the mass of the public was concerned The subject-matter of mediaeval painting was almost entirely religious, yet it was significant how often the lives of the saints enabled the artists to betray their own humanistic sympathies and interests In those early days it was dangerous to be pacific or perhaps even benevolent, but the artists did employ all the latitude allowed them by the Church to reveal their humanistic sympathies Mr Rothenstein observed that always around the saints performing miracles there were represented unusually dignified and noble-looking men whom he took to be, perhaps without justification, the scientific men of the period In view of such gravity in portraiture as was expressed in great mediaeval and Renaissance art, he could not believe that the men there portrayed lived entirely in a world of superstition and charlatanism He showed a series of lantern slides of reproductions of great pictures of the old Italian and Flemish school, and called attention again and again to the splendid representation of the healer or doctor of the time It had to be remembered, in looking at pictures from the standpoint of accuracy of representation, that there had been two main streams of art On the one hand, there was the epic or Miltonic spirit in which the artist dealt with world forces, and realized that the nice precision of detail would take away from the big quality of his theme, and, on the other hand, there was genre painting in which the artist dealt with particular sections of life In the latter, he believed, the artist would be found to be as accurate as any scientific physician could wish him to be During the Renaissance, when medical science was beginning to assert itself, when the scientific spirit was allowed for the first time free expression, the artists also became interested in the more scientific aspects of art—namely, perspective and anatomy He could not believe that Greek learning, coming suddenly into Italy, threw so great and new a light upon Italian learning as the pages of history suggested The truth was that the opinions which men had held in private they were at last allowed to express, and this new Greek learning permitted men who had suspected certain scientific truths to utter them for the first time without fear of the dungeon or the stake This was true both of art and of science The study of anatomy undoubtedly helped artists, like Michael-angelo who were under the necessity of painting figures in violent movement, a movement which they could not study from life, but which anatomical knowledge helped them to express In the representation of still figures, the lecturer did not believe anatomical knowledge to be necessary, because the appearances hid what lay behind them The artist worked with his eye, and the fine eye would see and enable the hand to express what the mind did not understand Intuition, in fact, in Mr Rothenstein's belief, was the basis of both artistic and scientific thought The difference between the intuition of the artist and the intuition of the scientific man was that the artist could oftener in the past express his intuitions fearlessly, while the scientific man went in some degree in fear of his fellows The Einsteins and Newtons probably had their intuitions in a flash, but they had to spend a lifetime interpreting them to others The medical man of former times with an acute knowledge of the human mind and a profound observation of what happened in life, was probably as good a medical man, without modern knowledge as many living to-day It was always possible that the medical man, even when equipped with scientific knowledge, might use formulas to no purpose, whereas a man of finer observation and intuition, and with less book learning, might in the end be of more service to mankind The illustrations shown by Mr Rothenstein in support of his theme ranged from "The Dying Gladiator" in the Capitoline Museum, down to the fine and eager heads of the students in Rembrandt's "Lesson in Anatomy" at The Hague

FAITH HEALING IN THE POTTERIES

A SHARP controversy has arisen in the Potteries as a result of missions conducted by a certain Pastor Jeffreys—head of an evangelistic society working from Bristol—who unites with the usual methods of revivalist preaching a faith healing campaign for which sensational results are claimed It appears that in the course of a mission at Hanley at the end of September, when some people declared themselves miraculously cured of certain ailments, Pastor Jeffreys, after his "treatment," which, he says, consists only of prayer, removed the splints of certain cripples, patients at the hospital of the North Staffordshire Cripples' Aid Society at Hartshill, who had been referred by the local authority to that society for orthopaedic treatment Dr W Mitchell Smith, who is honorary medical officer in charge of the hospital, and surgical tuberculosis officer in the Potteries, brought the matter to the attention of the medical officer of health for Stoke-on-Trent, Dr A Wotherspoon, who laid it before the Health Committee of the City Council Dr Mitchell Smith, as we gather from the *Staffordshire Sentinel*, was quite specific in his allegations Three cripples who attended the meetings and had their splints removed were suffering from tuberculous disease of the spine, these patients were fixed on frames, and the revivalist took off the frames when the condition was such that no orthopaedic surgeon would have dared to do so In another case of tuberculous disease affecting a joint, active and with flexional deformity, which had been fixed in a bed splint and guarding plaster, the appliance, Dr Smith learned, had been removed In yet another case, with a leg shortened to the extent of four inches, which had been fitted with a raised boot and calliper to prevent distortion to the spine, the calliper had been removed, and, again, in a child with a bad knock knee, a plaster cast had been taken away The desire to collect discarded crutches and other appliances as trophies has always been a characteristic of the faith healer, but it is obvious that this cannot be tolerated by any authority responsible for clinical treatment The first reaction of the local authority to these proceedings was to cancel some future bookings by the faith-healer of halls under its control at Burslem, Hanley, and Longton, but on further consideration it was decided by the General Purposes Committee that Pastor Jeffreys would be asked to give an undertaking not to interfere with the splints of children undergoing treatment at the orthopaedic hospital for whom the corporation was responsible, and that in the event of non-compliance the cancellation should take effect This action aroused among Pastor Jeffreys's followers great demonstrations of protest A petition was organized to which, it is stated, thousands of signatures were at once attached The matter threatened to influence the municipal elections The evangelist himself adopted at first a recalcitrant attitude He declared his determination to continue his mission in the Potteries, and said that if the corporation closed its halls to him he would endeavour to acquire privately owned halls, or, failing this, build premises of his own He also stated that he had never personally induced a cripple to cast off a crutch or support, and he had never removed an implement without the expressed desire of the patient and the consent of the parent or other person responsible He challenged Dr Mitchell Smith to furnish him with the names of any who were worse off as the result of his prayers, and declared

that for every such case that Dr Smith could cite, he could bring forward twenty who had received healing and blessing at his services But he expressed himself as prepared to give an undertaking that crippled children wearing leg supports or plasters under treatment by the various authorities should not undergo interference at his hands This undertaking was felt not to go far enough, and a more definite reply was demanded with an extension of the undertaking to exclude altogether the 'treatment" of children for whom the corporation was responsible Upon this, Pastor Jeffreys, declaring that his society placed the salvation of souls on a plane of much greater importance than the healing of the body, gave an undertaking that he would not deal in any manner at his revival and faith-healing meetings with crippled children for whom the corporation is responsible On this promise it was agreed to allow him the use of the halls for his November campaign The Stoke City Council is to be complimented upon maintaining a quite definite position and no less upon gaining its point without giving any real ground for an accusation of intolerance It would be regrettable if the action of the city authorities had resulted in placing a ban upon a work which—these healing demonstrations apart—is by all accounts exercising a beneficial influence upon the life of the community

PROFESSOR ERNST FUCHS

With the passing of Professor Fuchs, one of the great figures of international ophthalmology has gone to his rest, a much respected friend and mentor, who was held in high estimation and affection all over the world Though in his eightieth year, he was active almost to the end of his life for he was present at the thirteenth International Congress of Ophthalmology, held at Amsterdam last year, and he visited the United States after the congress was over to give one of the three addresses with which the Wilmer Ophthalmological Institute was formally opened in the autumn of 1929 Fuchs's name is inseparably connected with Vienna and the Viennese school of ophthalmology, he was a worthy successor of Arlt and Jaeger Under his care the ophthalmic school not only maintained but even increased, the reputation bequeathed to it by those great masters A pupil of Arlt, he migrated to Liège where he was professor of ophthalmology until 1885 It was in the year 1884 that he gained a prize at the fifth International Congress for Hygiene at The Hague for his essay entitled 'The causes and prevention of blindness" In 1885 he returned to Vienna, succeeding Jaeger as professor of ophthalmology, thenceforward the Viennese school was Fuchs, and Fuchs only *Facile princeps* as a clinician and unrivalled as an ophthalmic pathologist he soon became recognized as the foremost teacher of his specialty in Europe A steady stream of papers appeared in the various ophthalmic journals, and many ophthalmic conditions became known by his name—such as the superficial punctate keratitis and the inferior crescent or Fuchs's coloboma His *Lehrbuch der Augenheilkunde* has run through innumerable editions in German, and translated by Duane has been the textbook of the English speaking race for all senior students and practitioners for the past forty years Last year he received the Leslie Dana gold medal for his work on the prevention of blindness, this medal was presented at the congress at Amsterdam and Fuchs was the first man outside America to receive it In the year 1902 Fuchs gave the Bowman Lecture before the Ophthalmological Society of the United Kingdom his subject being his favourite 'keratitis' and from 1903 till his death he was one of the very limited number of honorary members of the society The respect in which he was held in this country is evidenced by the fact that his honorary membership was not disturbed by the great war On retiring from the professorship at Vienna, Fuchs found himself in straitened circumstances, due to the war, his scientific achievements were recognized universally, and he embarked upon a world wide tour of lectures visiting Spain the United States and Latin America By these means he was able to keep the wolf from the door and the ophthalmic world was spared the sad spectacle of one of its foremost representatives living or dying in want All honour to his American colleagues

BRITISH CONGRESS OF RADIOLOGY

An interesting programme has been arranged for the annual congress of the British Institute of Radiology (incorporated with the Röntgen Society), which is to take place at the Central Hall, Westminster, from December 3rd to 5th On the afternoon of the first day the president of the Institute, Mr C F S Phillips delivers his address from the chair The second morning is to be devoted to the discussion of technical papers, on the physical and instrumental side of x-ray work and the third morning to medical papers, one of them by Dr H A Harris entitled 'The growth of bone as illustrated by radiography" and the other which is to be illustrated by cinematograph films by Dr Donald Hunter, on Changes in the bones in hyperparathyroidism and hyperthyroidism' The two memorial lectures which are held under the auspices of the Institute are arranged for congress week The first of these is the eleventh Mackenzie Davidson Memorial Lecture, by Professor C P Thomson, on "Some recent experiments on cathode rays," which is to be given on the afternoon of December 4th and the other, to be delivered on the following afternoon, is the thirteenth Silvanus Thompson Lecture, by Dr A F Barclay whose subject will be "The danger of specialization" Thus a lecture in memory of a medical man will be given by a physicist and one in memory of a physicist given by a medical man The closing event of the congress will be the annual dinner on December 5th at the Trocadero Restaurant About twenty-four firms are contributing to an exhibition of x-ray and electrical equipment and sundries which is to be opened on the first day by Sir Humphry Rolleston

SOCIETY OF BRITISH NEUROLOGICAL SURGEONS

The Society of British Neurological Surgeons has met twice this year—in Paris during the month of June under the presidency of Sir Percy Sargent and in London in November, under the presidency of Mr Donald Armour In Paris the members of the society paid visits to the clinic of Dr Andre Thomas, who showed cases of surgical interest, including a demonstration of the pilomotor reflexes, to our knowledge of which he has contributed so greatly A visit was also paid to the Hopital de la Salpetriere, where cases were shown by Professor Alajouanin M de Martel performed several neurological operations on three days and Dr Clovis Vincent also did a laminectomy for an intramedullary tumour of the cord At the recent meeting in London Mr Bathe Rawling and Mr Wakeley performed operations at the West End Hospital for Nervous Diseases Regent's Park and their colleagues notably Dr Worster-Drought and Dr Carnegie Dickson, made the meeting a most agreeable one by their demonstrations of cases pathological specimens and the like Mr Lambert Rogers made a communication on the nature of the foramen of Magendie The society's dinner was held at the Langham Hotel in the evening

We much regret to announce the death of Professor John H Teacher of Glasgow, whose paper on the "Normal structure of endometrium and decidua and the menstrual cycle" appears by a sad coincidence in our present issue We hope to publish an obituary notice next week.

ROYAL SOCIETY OF MEDICINE

The Duke of York at the Annual Dinner

The annual dinner of the Royal Society of Medicine was held on November 20th, when about 350 Fellows and guests assembled, under the presidency of Dr T Watts Eden, at the May Fair Hotel The principal guest was H R H the Duke of York On the other side of the President was the Bishop of Birmingham (Dr Barnes), and he was supported also by the two immediate Past-Presidents of the Society, Lord Dawson of Penn and Sir StClair Thomson Other guests at the principal table were Lord Moynihan (President Royal College of Surgeons), Sir Farquhar Buzzard, Professor Arthur Burgess (Acting President, British Medical Association), Sir Ewen Maclean, Sir Henry Simson, Sir Francis Shipway, Sir George Buchanan, Dr R A Young (President, Medical Society of London), Dr T Vincent Dickinson, and the editors of the *Lancet* and the *British Medical Journal*

The Duke of York proposed the toast of "The Society," and created a smile by reminding the company that the Society, under the name of the Medical and Chirurgical Society, had its origin a century and a quarter ago in a tavern, not the only great thing in history which boasted a similar genesis After a reference to the Society's long list of eminent presidents, His Royal Highness continued "No one can fail to rejoice that your Society maintains its standard of achievements upon so high a level I specially admire the desire displayed by your council to make the Royal Society of Medicine an institution which shall stimulate and encourage its Fellows in their labours, however far they may be scattered at the outposts of Empire" He mentioned the library, with its information service, saying that he had been told that the librarian, having received an urgent cable from Iraq for medical information, immediately had photographs of valuable scientific papers prepared and dispatched the same day by air mail to that distant spot He spoke also of the usefulness of the Society's *Transactions*, carrying knowledge, through the papers and discussions, to medical men in every part of the globe He concluded by wishing the Society "good fortune and success"

Dr Watts Eden, in reply, made suitable reference to the great interest taken by the Royal Family in organized medicine He claimed for the Sections of the Society that it was there that medical opinion was formed One of the important tasks of the Sections was to examine new methods and departures of all kinds, and assess their value A new idea could not run the gauntlet of informed criticism in the Sections unless it was sound, and many an unsubstantial project had been exploded in that way It must be admitted that medical opinion was a somewhat elusive quantity, necessarily ill defined and difficult to grasp Members of the medical profession were often found to hold discordant or even contradictory views about many things But at least the medical profession was not the only one in which such differences were found It would be better to regard all such differences as evolutionary phenomena The need for a clearing-house of medical research, Dr Eden continued, was never greater than to-day, but the army of original workers was never so formidable From time to time even medical terminology was reduced to emptiness by the progress of science, and discussion in some of the Sections now proceeded in a vocabulary unknown twenty-five years ago Yet the profession must not allow itself to be swept off its feet by the enthusiastic search for something new After all, it existed to render to the community practical service, and, while it was granted that knowledge was in itself a great and desirable aim, some organization was required to translate into comprehensible terms [illegible] in such bewildering profusion The Society collectively could comprehend the whole field, arrange the patchwork results of research into some useful pattern, and formulate the generalizations which were essential for the practical application of experimental results

Dr F M R Walshe proposed the health of the guests, and in one amusing passage sketched that grotesque figment, the doctor of the novelist, the playwright, and the journalist

"An amazing number of components go to make up the doctor of modern fiction, and he is a far more dashing figure that the Doctor Slop who haled poor Tristram Shandy into this world by the nose First and foremost, he must be a surgeon, a surgeon of incomparable skill and strong sex appeal He lets blood copiously with long sensitive fingers and the calm of the strong silent man Incidentally, he is also a famous bacteriologist and a forensic pathologist of world repute When he is not being followed round the wards of his hospital by flocks of adoring students, he runs a busy general practice He never charges his patients any fees He never has wife or encumbrances, but keeps a dark mysterious man servant His spare time is devoted to straightening out the unending complications that punctuate the private lives of his friends, many of whom are mysteriously murdered Finally, and perhaps not altogether surprisingly, he is a source of ignoble jealousy in his professional colleagues I have never seen it explicitly stated, but I am convinced that he wears a fur lined overcoat and travels first class on the railway In this he comes nearest to the true surgical tradition"

The Bishop of Birmingham, in responding to the toast, said that the most exhilarating element in scientific research was that one never knew when a period of exceptionally important advance was at hand or in what region the next great discovery would lie

"It seemed at the end of the nineteenth century—I was discussing this with Sir Oliver Lodge only a night or two ago—when I was an undergraduate, that the great era of physics had closed Yet a greater era than that of Faraday, Maxwell, and Kelvin was just beginning We see now that the physics of the great Victorians was but, as it were, a twilight before the dawn—a dawn made splendid by J J Thomson's electrical structure of matter, Planck's quantum theory, and Einstein's generalized relativity Equally in medicine there may come at any time a group of discoveries in biochemistry which will enable medicine to give to the body an immunity from ill health such as has only been enjoyed by exceptional individuals in the past In fact, in our modern world, in spite of political, social, and moral disorder, it is good to be alive There is among us the joyous and adventurous freedom which burst out at the Renaissance four and a half centuries ago Never since the Golden Age of Greece has mental energy been more fertile than it is now"

Dr Barnes went on to discuss what probability there was that the present era of scientific progress would come to an end—that the Dark Ages would again overwhelm Europe

"Medical skill and public hygiene will ultimately be racially disastrous if they preserve inheritable mental and physical defects in humanity We now know that dysgenic mutations can occur alike in plants and animals, as it were spontaneously, at any rate, knowledge as to their origin is lacking Had we such knowledge, we might, of course, be able to prevent their occurrence But all we can at present say is that, having appeared, they can be inherited, and unless they are eliminated by a hostile environment they remain a permanent menace to the community Now medical science destroys the power of hostile environment, but leaves these inheritable characters untouched To the category of such dysgenic mutations belongs apparently the group which gives rise to mental defect in man The existence of this type of social degeneracy is a grave menace to our welfare as a community, and the families in which the defect is latent make up inferior racial stocks amounting to some 10 per cent of the whole population Accurate genetic knowledge is most urgently needed, and a beneficent millionaire, anxious for the future of his country and humanity in general, could well provide laboratories and chairs in all our great universities"

Finally, allowing the imagination to play with the far future, the Bishop asked whether man would be transient on the earth, like the great reptiles, like many of the most highly organized mammals And if man did pass from this globe would some new form of life, higher in the evolutionary scale, in due course lord it over the earth and reconstruct our achievements and our existence in its schools of antiquarian research? He could ask such questions without anxiety, and would receive the answer without dismay, for he was certain, not only that man's permanent habitation was not on earth, but also that his spiritual achievements were imperishable Aspirations and achievements, moral loyalties, love and service would not vanish as though they had never been

PHYSICAL AND PSYCHOLOGICAL DEFECTS IN CHILDREN

CONFERENCE OF VOLUNTARY ASSOCIATIONS

THE Invalid Children's Aid Association and the Central Council for the Care of Cripples recently held a joint conference in London to consider problems relating to those, especially children, who are handicapped by physical and psychological defects. Representatives of local authorities and voluntary bodies from all parts of the country attended to hear papers read by a number of experts.

The conference was opened by the MINISTER OF HEALTH who paid a tribute to the work of the two convening bodies, and said that he knew orthopaedic surgeons would be the first to admit the value of the educational and propaganda work which the two societies had so successfully undertaken. The societies were early in the field in realizing the enormous importance of utilizing to the full the knowledge, skill, and experience of orthopaedic surgeons. Local authorities had an important part to play in the treatment of little children, but, unfortunately, in spite of the progress which had been made there were still many areas in the country in which no facilities existed for the treatment of crippling conditions. He was personally highly gratified at the response which local authorities had in general made with regard to the provision of schemes for orthopaedic treatment and after-care. He gave some figures illustrating the progress made during the period 1926 to 1930. The number of approved schemes by local authorities for maternity and child welfare had increased during those years from 43 to 193, and similar progress was to be noted in dealing with tuberculosis and in other directions. It would probably be difficult to find such rapid progress in any other branch of the public service, nevertheless there were still many gaps which he hoped would soon be filled. The ideal scheme which he desired to see in operation all over the country was to have central open air hospitals supported by a chain of clinics. He fully realized the many claims on local authorities but he thought it right to urge them in their own interests to develop this extremely important side of preventive work. It was almost impossible to translate human loss and suffering into money, or into terms of the burden upon ratepayers, but it was quite clear that there was enormous material loss caused by the continued existence of crippling diseases which might be wholly or largely removed if treated at an early stage. Local authorities, by reason of their permanence could afford to look ahead. All sections of the public health service were handicapped in particular because the child was lost sight of from the time that the maternity and infant welfare centre had finished with him until he reappeared in the elementary school and came under the care of the school medical service. If the voluntary bodies and local authorities could between them ensure that the child was not forgotten after the first year of life the Minister was certain that much would have been done to cut away the roots of many of the most serious and damaging diseases.

Prevention and Treatment of Crippling Diseases

Sir ROBERT JONES, Bt., who presided over the first session said that much had already been achieved in the training of cripples and in finding them suitable employment subsequently. In a number of cases an effort had been made to start a colony in which such patients could reside and undertake whatever employment they were able. With regard to the adult cripple there seemed to be the greatest difficulty in finding suitable accommodation in hospitals, and there was great necessity for increased effort in that direction.

Mr A. H. WOOD (vice-chairman Central Council for the Care of Cripples) reviewed the progress which had been made since the previous conference in 1926. Those concerned saw with gratitude new hospitals, new clinics and new schemes come into existence; above all they were watching a more enlightened public opinion taking shape, a better knowledge of what was wanted, and a greater willingness to carry that knowledge to practical effect. He believed that this country was alone in having devised a scheme by means of which public authorities and voluntary societies co-operated to their mutual advantage. That was one of the arrangements, in itself entirely illogical which seemed to appeal to people of British traditions, and which would break down at once if it were worked by others of a more logical and orderly mind. The lambs of the Invalid Children's Aid Association and the Central Council for the Care of Cripples had not been devoured by the lions of the county and county borough councils, on the contrary, they had lain down in safety and amity, and there were very few places where the public authority and the local voluntary societies did not supplement each other's work, and this without friction or jealousy. On the administrative side the outstanding progress made during the last four years had been in the linking up of the work of the different agencies. It was a truism to say that the essence of all sound remedial work for children was early discovery of the defect. The school medical service was playing a splendid part in such discovery, but it had become more and more obvious that a service which only began to operate when children were 5 years old did not begin early enough. It ignored those first vital years of a child's life, and from all points of view especially that of the orthopaedic surgeon it was essential that the agencies which came into contact with the early life of the child should be linked up with those which dealt with the child of school age. With regard to results during recent years, the most important fact on the orthopaedic side was the establishment of no fewer than five new orthopaedic hospital schools since 1926. Two of these new hospitals had been established by public authorities (the Derbyshire and Lancashire County Councils) and the others in the Devonshire, Bristol and Nottingham districts, by voluntary effort. Increased attention had been given to the training and employment of cripples, and on the invalid children's side of the work also some encouraging progress was to be reported.

Dame GEORGINA BULLER (Devonian Association for Cripples' Aid) described the work of local orthopaedic associations. An orthopaedic unit she said did not consist as it was at first thought that it should of a hospital with associated clinics. The clinical aspect was and must always remain at the heart of the cripple problem but it was not the whole of it. The cripple must not be considered solely in the terms of a patient. Many went to the hospital more still to the clinic but an appreciable residue went neither to the one nor to the other yet were none the less in need of help. Information as to the number of cripples in the country would never be complete if drawn solely from the records of a hospital or health office. She believed that along the lines of local associations co-operating with each other and co-ordinated on a national basis the true proportion of each part to the whole would be secured and the way prepared for further advance.

The first session concluded with an address by Dr S. J. C. HOLDEN (M.O.H. Buckinghamshire) who spoke on co-operation between child welfare centres the school medical service and hospital schools and suggested ways in which the services of the various county organizations might be enlisted for the ascertainment of defects and for setting in motion the following up machinery.

Rheumatic Heart Disease

The second session over which Sir GEORGE NEWMAN presided was devoted to the prevention and treatment of rheumatic heart disease.

Dr F. J. POYNTON (Hospital for Sick Children Great Ormond Street) dealt with the subject of acute rheumatism in the young (5 years and under). The disease he said, was most frequent round about the tenth year and was said to be rare under 5. There was a danger in that statement because it might lead to a false sense of security in overlooking its occurrence. A good many years ago without much difficulty he collected over fifty cases in young children under his own care, and seventeen more from records. Later he found in a series of 100 cases of rheumatism in his ward that twelve commenced at or

under the age of 5 He had steadily continued his inquiries up to the present time, and had collected more evidence In the last year he had had two fatal cases at Great Ormond Street, and another little girl with a damaged heart, but not fatally so, her rheumatism had commenced at the age of 2 years At University College Hospital he had records of another sixteen cases during the years 1925 30, and thirteen of these had organic heart disease If one searcher could put his hand on so many cases, the suspicion naturally followed that rheumatism was *more* frequent at this early age than was supposed How serious the disease was said Dr Poynton, could easily be illustrated Thus in fifty-two cases there were eight deaths, and five more patients were hopeless invalids, twenty-two made partial recoveries with permanently damaged hearts In round numbers at least 16 per cent of cases proved fatal, many of them in the first attack, these could be contrasted with a series of older children, of whom about 10 per cent died in the year, in which the type of rheumatism was more than usually virulent An important point was that in these young children heart disease might be, and he believed was, the outstanding event, arthritis and muscular pains might be so comparatively slight that the transition was overlooked, though obvious arthritis was also not infrequent It was an axiom in clinical medicine that when one got off the right track in diagnosis of an illness one might miss the obvious, thus it happened that a very young child was thought not to be really ill until suddenly the worst form of rheumatic heart disease developed This feature of rheumatism required a prolonged investigation, not by one individual, but by many all over Great Britain Such an investigation would make it possible, in a few years, to give to the public reliable evidence as to the real frequency of acute rheumatism in the first five years of life, together with its relative mortality

Dr Carey F Coombs (Bristol General Hospital) described the steps taken in his area whereby it had been possible to bring into being a co-ordinated plan for dealing with juvenile cardiac rheumatism It was decided to invite practitioners within a limited area—Gloucestershire, Somersetshire, and Wiltshire—to send in reports of cases answering to a certain definition of rheumatic heart disease occurring in children of school age and arising within a limited period The project was assisted by a grant from the Medical Research Council, as well as by the moral support of the Ministry of Health and the British Medical Association The data, if they were to have any research value had to be submitted to some standardizing authority, and in this respect those concerned were fortunately able to secure the help of colleagues throughout the area chosen, who saw the children referred to them from the public elementary schools for an opinion as to the condition of their hearts Thus it was possible to offer to the public authorities experienced service in the sorting and disposal of their school children with cardiac defects, and in exchange to receive the assistance of those authorities in recording and in further investigation It would take some months to deal with all the observations and assimilate them into a report On the treatment side it was significant that all the local authorities concerned wished the clinics set up for the examination of these children to continue They believed that it had been of enormous value to them to have a court of appeal in cases of doubt and to receive advice as to lines of treatment The experience of treatment, limited though it was, had taught three valuable lessons (1) Patience and perseverance in oversight and control of these children would meet with a certain amount of reward In children who would have become worse without these services the disease appeared to be arrested, or at all events retarded, in a few the signs of disease had practically disappeared (2) For a large number of these children nothing more was needed than repeated examination, if this was frequent enough, it was able to detect recurrences and recrudescences which might otherwise be overlooked, and thus timely treatment could be instituted (3) In a smaller number of cases prolonged treatment in a hospital-school was advisable A serious gap in the organization for dealing with this, as with many other diseases arising in childhood, was the absence of a domiciliary service A formal report had been made to the family doctor on each child examined, and there was reason to think that this step had been of some little value The trouble was that there were many working-class families where the doctor was not called in as often as he should be, for no other reason than that means were lacking Instead, the children were brought to hospitals, where they found the out-patient department an indifferent substitute for the services they ought to be getting at home, for no medical service could care adequately for the health of the nation that was not based on the recognition of the family as a social unit

Dr B E Schlesinger spoke on the great importance of prolonged convalescence for children recovering from a recent attack of rheumatic carditis There must be general agreement, he said, that amidst the ideal surroundings of a country hospital the majority of children improved, and the incidence of relapse was very low He quoted some figures from New York in support of this view 512 children were discharged from five convalescent homes during the year, and of these the general condition was considered improved in 448 Convalescent treatment greatly lessened the number of relapses, and minimized their severity if they occurred

The Backward and Difficult Child

Another session of the conference was devoted to the problem of the backward and difficult child It was presided over by Dr R H Crowley (senior medical officer, Board of Education), who said that a beginning was only just being made in understanding the behaviour of children, the field to be explored was immense Dr G A Auden (school medical officer, Birmingham) opened the subject in an able paper in which he gave examples from history of crippling and deformity in distinguished individuals which had probably resulted in the warping of the mind, with results sometimes, if the victims were in positions of power, of great misfortune to the world The problem of dealing with abnormal children was intensified by the absence of real tests of temperament except by trial and error The difficulty lay in large part in the false values of life which the competitive struggle of the world to-day did so much to foster

Miss L S Fildes (chief psychologist to the Child Guidance Clinic, Highbury) gave an account of some difficulties which arose within, and were partially occasioned by, the school system Dull children were among the most deprived educationally, they were neglected in school for the most part, and so they developed a feeling of inferiority which prevented them from making good in life Dr William Moodie, of the same clinic, said that much of the trouble concerning the behaviour of children was due to lack of foresight He had noticed how often a habit of stammering, which a child had always had in some degree, became worse when the child was just about to leave school and enter employment The reason was not hard to find School was now a very pleasant place, and to leave school and go into employment was for most children an unpleasant thing, so that any symptom which would tend to prevent the individual taking his place in the labour market would be exaggerated just at that time He believed that by an investigation of the environmental situation and adjustment where it was necessary behaviour difficulties could be corrected in 90 per cent of children Dr R D Gillespie pointed out that the manifestations of mental and nervous disability in childhood were not only of interest in themselves but of the first importance for the prevention of definite illness and incapacity He thought it essential that official bodies interested in public health should pay greater attention to the neuroses of children than they did at present Dr Letitia Fairfield commented on the enormously wide range of the subject One of the principal troubles at the back of this psychological problem was the fact that for fifty years there had been a struggle to win a bare minimum of teaching for the average child in the elementary school, a bare living wage for the teacher, and bare average equipment for the school, there had been very little time or money to spare for the equally important problem of seeing that each child had the education which he really ought to have Thus it

happened only too frequently that children leaving school at 14 had passed through the school without having learned anything at all although it was true that many of them made much better adjustments in after life than they did during their school period Nature was very elastic and gave everyone many chances, but it was no light thing to have wasted deliberately the best and most formative years of an individual's life Dr EMANUEL MILLER dealt with the subject of temperament in children, and Miss CLEMENCY PAINE contributed some remarks on the problems of the delinquent child from her experience as probation officer in a children's court The discussion closed with some emphatic remarks by a member of the National Union of Teachers Mr CHUBB, who asked the conference to remember that it was one thing to take an individual child in the laboratory, as some speakers had done and quite a different thing to have the difficult child as one member of a class of thirty or forty children What was wanted was more money to deal effectively with education, and he thanked Dr Letitia Fairfield for her reminder that the children in the schools at present only received the minimum of teaching for the average child

Still another session of the conference was devoted to the industrial outlook of the physically disabled, at which some account was given by Dame AGNES HUNT of village settlements, and by Dr P C VARRIER-JONES of the organization at Papworth The session was presided over by Mr J J LAWSON (Parliamentary Secretary of the Ministry of Labour) who stated that there were now 26 000 employers on the King's Roll, employing 370 000 disabled ex-service men

THE HOSPITAL FOR TROPICAL DISEASES

OPENING OF NEW WARDS, LABORATORIES, AND MANSON LECTURE THEATRE

THE formal opening of the new wards, pathological laboratories and the Manson clinical lecture theatre at the Hospital for Tropical Diseases Gordon Street London was performed on November 20th by Mr WILLIAM LUNN (Under Secretary of State for Dominion Affairs) in the presence of many of the officers and members of the Committee of the Seamen's Hospital Society (whose president Sir ARTHUR CLARKE, acted as chairman) and representatives of the medical and nursing professions the Army and Navy and the Colonial and Diplomatic Services

Sir WALTER FLETCHER secretary of the Medical Research Council spoke on the inspiration of Sir Patrick Manson on reminding his hearers of the founding by Manson of the Seamen's Hospital Society in 1899 At that time a school of tropical medicine had been attached to the Albert Dock Hospital twenty-one years later the coming of age of the combined hospital and school had been celebrated by their removal into the present building which was the gift of the British Red Cross Society and the Order of St John Five years afterwards the School of Tropical Medicine was incorporated with the London School of Hygiene and Tropical Medicine now in Gower Street but the hospital and the school continued to co-operate in their daily work by a free exchange of facilities under a common staff The opening of the new buildings for the school had made possible the expansion and improvement of the hospital at a cost of £13 000 by the provision of additional ward space, a new operating theatre a range of well-equipped laboratories and a new lecture theatre for clinical demonstrations which would be dedicated to the memory of Manson the father of tropical medicine in this country The hospital said Sir Walter Fletcher was doing a great work in the relief of those suffering from tropical diseases, irrespective of class creed, or colour The patients came from all parts of the Empire, and included officers and men of the mercantile marine planters engineers traders, missionaries explorers, and servants of the State The poor were treated free of charge while those who could afford it paid fees in accordance with their means The hospital also afforded opportunities for the training of medical men and nurses for service in the Tropics and for the research work on which the hope of progress in the future was based

Tribute to Manson

Sir Walter Fletcher went on to say that by the death of Sir Patrick Manson many of those present that day had lost not only a great teacher and wise adviser, but also a warm hearted personal friend He died in 1922 the year after the hospital and his own school came to this building The country lost him at a time when the growth and development of tropical medicine here had reached some difficult and critical stages We must not dwell upon the differences it might have made to us if his guiding mind had remained to help for a few years longer But we can find no better pattern and example than those he set before us for the work that lies so urgently at hand What are the chief lessons he taught, not only by word but by his life and work? He showed that the clinician dealing with disease must be prepared himself if he is to advance knowledge to give his own time and to acquire his own skill in pursuing his observations by the technical methods of the laboratory and in testing his results by the method of experiment Manson was not one of those who while pursuing busy professional practice, complain that others are not making researches enough for their aid Amid great difficulties abroad isolated from other workers and from books he made discoveries of epoch making importance When he came to the hard work of practice in London he still led the devoted life of the man of science, giving up time from work of immediate profit in order to read and think, observe, describe and experiment in his own laboratory He gave lavishly of his time to the help of younger men He ought opportunities for them gave them freely of his stores of experience and knowledge and in their successes gave them generous praise and all the credit Both by word and example he taught that a man if he is to make new advances must live for research, and not give it lip service only or distant patronage He reminded the younger worker that he must take his problems about with him always and that he must be ready at any time or place to get the hint of a new clue to be followed or the idea of a crucial experiment to be done This might come to him in his hot bath as easily as in the ward or the laboratory Manson indeed will always have a proud place in that wonderful galaxy of medical practitioners belonging to the later Victorian age—Lister and Horsley among surgeon Hughlings Jackson Gowers Ferrier Mackenzie and Head among physicians—who with burning zeal and self-sacrificing altruism made their professional practice the servant of their scientific work We look round with hope that the attitude and the spirit of men like these may arise among us again in fuller degree within the present reign We can truly apply to Patrick Man on the words that Izaak Walton wrote of John Donne His mind was liberal and unwearied in the search of knowledge with which his vigorous soul is now satisfied'

'Never were we in greater need than now of the legacy he left us of inspiration and leadership The gleams of knowledge we have already gained in the field of tropical medicine, or in any other field do but show us how vast indeed are the spaces of our ignorance We are under constant temptation to sit down satisfied with the first beginnings of new knowledge Let me give you one instance out of many Every schoolboy every Cabinet Minister knows now that malaria is due to a microscopic parasite transmitted by the mosquito The contribution made to this chapter of medicine by the arduous work of Ross under the direct inspiration of Manson is *much too often* described in popular literature and in the press as if it were equivalent to the conquest of malaria You do not conquer your enemy by merely learning who he is how he is posted, or what his transport is The Manson-Ross discovery was made in India a third of a century ago, yet to-day there are more and not fewer, sufferers from malaria in India than then Where is the conquest? What we have learned though we have been slow enough to put it into practice, is that our campaign must be fought

should be met by an increase in the fee chargeable for attendance on pregnancy and labour Any attempt to separate ante-natal supervision from the remainder of the services rendered by the midwives was deprecated The Board considered the question whether three years' general training in a hospital in the British Empire outside Great Britain and Ireland should entitle a candidate to be admitted to its examination after a similarly reduced period of midwifery training It was decided that such training within the Empire, but outside the British Isles, could only be recognized as adequate if the instruction given by the hospital had previously been officially recognized by the Board, or if the general training there would render a candidate eligible for registration by the General Nursing Council for England and Wales The report of the Board for the year ending March 31st, 1930, was approved

Ireland.

Tuberculosis Scheme in County Antrim

The County Antrim County Council, on the recommendation of the Tuberculosis Committee and on the suggestion of Dr C O S Blyth Brooke, chief tuberculosis medical officer, has adopted a scheme for dealing with tuberculosis This scheme includes the following provisions No immediate change is to be made in institutional form of treatment, but domiciliary treatment will be practically discontinued Patients in future will attend tuberculosis dispensaries only for examination and advice, the necessary treatment being given by the Poor Law dispensary doctor or by the patient's private doctor Additional nourishment will continue to be given to necessitous patients, and may be extended Provision is to be made at approved centres for facilities for x-ray examination of patients The reorganization of the dispensary class of treatment is held to be absolutely necessary, in order to supervise more fully the work throughout the county For this purpose the county will be divided into northern and southern districts The southern district will be in charge of Dr Ramsey, and will include the clinics of Antrim, Ballyclare, Carrickfergus, Larne, Lisburn, and Whitehouse The northern district, under Dr Hill, will include the following clinics Ballycastle, Ballymena, Ballymoney Randalstown, and Clough The council approved of the proposal to request the Ministry of Home Affairs to allocate a part of the £19,000 in its hands to the Forster Green Hospital, to help to meet the proposed outlay in purchasing the Galwally property adjacent to the present sanatorium

Town Planning and Hospital Sites

In the course of an address on hospital sites and town planning delivered at the opening of the clinical session of the Meath Hospital, Dublin, Dr Oliver St John Gogarty said that the public did not understand the tremendous difficulties town planning created He did not think that town planning would assist in the location of hospitals or nursing homes, and it would not be feasible to have such institutions in a particular area At present there was a sort of segregation, nursing homes were springing up in the south-east of the city A corporation would be able to make by-laws for a type of dwelling to be built or converted in a particular area It would be useful if, as in Chicago the residents of a particular area were consulted before a building was erected in it, and that something like two-thirds of the residents should be in favour of the erection before sanction was given Killiney, he said, was verdant with greengrocers and blooming with stockbrokers and other valetudinarians, living there because it was healthier They kept sick people in what they called nursing homes and all their hospitals were in the heart of the city They encouraged invalids to come from country places or to "go into a home" Why in face of what they knew, should patients not be given all the advantages of fresh air? Why should there not be a kind of Killiney for cripples and those afflicted not only with tuberculous bone disease, but with any kind of disease, not within the city, but within twenty minutes of it The value of the sites of the mid-city hospitals would, if realized, suffice to pay for an equivalent building on a site more favourable to the nursing of the sick The rateable value of the city area would be increased in direct ratio to the distance of each hospital from the town There was no by-law to prevent anybody with a tin table in a back room from setting up a private nursing home, and nothing to prevent a professional pariah from setting up a lazar house in the centre of the city There was no law to prevent diseased people from drinking from the public fountains in the city parks By holding up the Greater Dublin Act until the Town Planning Bill was passed, they could regulate and direct the growth of the city with the latest scientific knowledge available, and cease to mix the dying and the diseased with the healthy in the same street

Appointment of M O H for the Borough of Limerick

A letter was recently addressed by the Department of Local Government and Public Health to the Corporation of Limerick recommending the appointment of a whole-time medical superintendent officer of health for the city at a salary of £800 per annum This post was rendered vacant by the death of Dr M S McGrath Consideration was given by the department to the importance to the city of problems regarding sanitation, housing, control of infectious diseases, safeguarding of food supplies, and maternity and child welfare, which have to be dealt with by the chief medical officer The letter stated that the sanitary condition of the borough was far from satisfactory, and that the high rate of mortality from accidents of child birth was largely due to preventable causes The corporation decided to adhere to the previous arrangement of a part-time medical officer at a salary of £175

Salaries of Medical Officers

Owing to the present financial condition of the county the committee of Cork Mental Hospital has refused applications from officials for increases of salary, including an application from the resident medical superintendent for good service pay on completion of eight years' work in that position His present salary was stated to be £800 a year with emoluments At a recent meeting of the committee of management of the Fermanagh County Hospital it was unanimously resolved to increase Dr Kidd's salary to £750, and to ask the county council to adopt this sum as his official salary for the future

Scotland.

Proposed New Charter for Glasgow Royal Infirmary

At a meeting of the court of contributors to the Glasgow Royal Infirmary, held on November 19th, it was resolved to seek a supplementary Royal Charter with a view to increasing the scope of this hospital, in consequence of the changes introduced by the Local Government (Scotland) Act, 1929 Dr James M'Farlane, chairman of the Board of Governors, presided, and explained that the authority required referred to the powers given to local authorities to reorganize the hospital facilities at their disposal, and to provide hospital accommodation for the sick of all classes, including the sick poor As it was in the interests of the Infirmary that these additions should be made to its Charter, he moved the adoption of a resolution in favour of presenting a petition, this resolution was carried The powers sought to include authority to enter into agreement with the public authorities in regard to the provision of hospital accommodation, and also power to admit patients in consideration of charges made for their maintenance, accommodation, and treatment in such parts of the institution as the managers may select Glasgow Royal Infirmary is the first of the large Royal Infirmaries in Scotland to take these steps for the admission of paying patients

Officers Nursing Home in Edinburgh.

The new nursing home of the Officers' Association (Scottish Branch) at Belgrave Crescent, Edinburgh, which was recently opened by the Duchess of Atholl, M.P., is intended for officers and ex-officers of the Royal Navy, the Army (including the Territorial Army), and the Royal Air Force. No charge is made for maintenance or nursing, and officer patients may engage their own medical and surgical attendants, to whom they are responsible for payment of treatment. In declaring the home open the Duchess of Atholl said that part of the work done for the sick and wounded during the South African war had been the foundation in London by the Misses Keyser of a hospital for officers, which still carried on its beneficent work. The present home was the fulfilment of a long-felt want for a similar institution in Scotland. It was often difficult for the ex-officer to adapt himself to other forms of work, or even to find other work of any kind. The Duke of Atholl, president of the home, in thanking subscribers, said that the best medical advice and nursing service would be available.

British Empire Leprosy Relief.

An address emphasizing the necessity for financial assistance in combating leprosy was delivered in Glasgow on November 7th by Dr. R. G. Cochrane, Principal R. S. Rait of Glasgow University presided and said that leprosy was not unknown in this country, for there were actually at the present time about fifty cases in the United Kingdom—all, however, imported cases. There was reason to suppose that King Robert Bruce had died of leprosy, and the leper windows in the old churches of England and Scotland, through which the lepers watched the service, were still to be seen in some places. Dr. Cochrane referred to the fact that about seven years had passed since the inaugural meeting of the British Empire Leprosy Relief Association. Every year had opened up new opportunities, but lack of financial resources had prevented the association from taking advantage of some of them. An Indian council had been founded and, as the result of an appeal had secured £150,000, which was entirely expended in India. During the six years of its existence, the association had sent out at least one million doses of antileprotic remedies to workers in every part of the Empire, and had done much to publish information which was designed to assist in a better understanding of the clinical and pathological aspects of the disease. It was tragic that *in the whole of East and Central Africa there was no institution* comparable to the institutions in India, where medical officers and dressers could get a training in the diagnosis and treatment of leprosy. One of the most important branches of this work was the appointment of a special full-time leprosy officer in each territory where leprosy was prevalent. Referring to a visit to the Sudan, Dr. Cochrane said that he had recommended for discharge from leper settlements over five hundred patients who had been cured. He appealed for support for the association as a scientific body and for the generous help of the public, so that this terrible scourge might be controlled.

Central Midwives Board.

The examinations of the Central Midwives Board for Scotland, held simultaneously in Edinburgh, Glasgow, Dundee and Aberdeen, have just concluded with the following results. Out of 155 candidates who appeared for the examination, 145 passed. Of the successful candidates, 70 were trained at the Royal Maternity Hospital, Glasgow, 27 at the Royal Maternity Hospital, Edinburgh, 4 at the Maternity Hospital, Aberdeen, 7 at the Royal Infirmary, Dundee, 16 at the Elsie Inglis Memorial Hospital, Edinburgh, 2 at Stobhill General Hospital, 2 at Barshaw Hospital, Paisley, and the remainder at various recognized institutions.

Correspondence

TEMPORARY TREATMENT WITHOUT CERTIFICATE.

SIR,—In the recent correspondence on the Mental Treatment Act Dr. Vernon Davies points out (November 22nd, p. 886) that Section 5 as it stands means that any patient expressing 'unwillingness'—in any form—will have to be certified to enter an institution, even though the unwillingness" may be due to a greater or lesser degree to the impairment of the patient's judgement consequent on the form of mental disorder from which he is suffering and even although the doctor knows that the patient's decision is biased by his mental condition at the moment.

For example, a melancholic may object to going to an institution because 'there is no cure for me in any case, so that I may as well die at home", or an early schizophrenic may object out of sheer negativism. This to my mind, is a serious defect in the wording of the Section for, as Dr. Dillon says (November 15th, p. 843) most of the patients whom the Act is attempting to provide for are likely to be unwilling to enter an institution and, moreover, in such early cases the patients can usually so express themselves.

The purpose of the Act would, I think, have been better served if it had been left to the certifying practitioner to decide whether the patient's state of mind was such that his expression of 'unwillingness' should be accepted. It would seem that at present cases such as the examples quoted above will still have to wait until they are bad enough to be certified.—I am, etc.,

Bradford, Nov. 23rd. H. EDELSTON, M.B., D.P.H.

AVERTIN ANAESTHESIA.

SIR,—In the correspondence on avertin anaesthesia Mr. Basil Hughes says: "With very light ether infiltration anaesthesia or spinal anaesthesia for major operations in the vicinity of the diaphragm its use is a godsend."

A word of warning seems necessary here on two counts. Mr. Howard Jones emphasized a danger in high spinal block when reading his paper on percaine at the Royal Society of Medicine. Put briefly, it amounts to this: When most of the intercostal muscles are paralysed respiration is effected mainly by the diaphragm, and very little lung expansion takes place in the upper lobes. The result is imperfect lung ventilation, leading to anoxaemia. Anoxaemia is a cause of fatigue of the respiratory centre with resultant shallow breathing which increases the anoxaemia. This vicious circle can normally be broken by the inhalation of oxygen-carbon dioxide mixtures or, more simply, by rebreathing; but if the respiratory centre is already narcotized by avertin as well as fatigued, it may not respond, and prolonged artificial respiration will be necessary. I am sure that this is the mechanism of respiratory failure in the majority of high spinal blocks where avertin or large doses of morphine have been given beforehand, and the percaine or novocain is quite unjustly blamed for producing phrenic paralysis.

The other point concerns the prolonged post-operative period with shallow breathing and diminished reflexes. I believe that this conduces to poor lung expansion and subsequent broncho-pneumonia. The following case illustrates this. A woman, aged 50, in fair condition was to have a partial gastrectomy performed for ulcer. She was given avertin, 0·09 gram per kilo body weight, and an abdominal wall field block with 0·25 per cent. novocain and 1 in 200,000 adrenaline. The anaesthesia was perfect and she slept throughout. It was, to quote Mr. Hughes, "a real delight to the onlookers." Her pulse rate at the end of the operation was 80, and her respirations 16 a minute. After being put back to bed she slept for twelve hours and was drowsy for another twelve. On fully waking up she at once began to cough up muco-pus; her chest had moist rales all over, and she died on the third day from *broncho-pneumonia*, a condition which was verified post mortem. It is difficult to avoid the conclusion that avertin contributed to this patient's death.

If a basal narcotic is deemed necessary for high abdominal work, paraldehyde would seem to be preferable to avertin, since in ordinary doses no respiratory depression occurs. For intensely nervous patients, with high basal

methodic rates, however, overturn combined with other things affords an ideal combination for most extra-abdominal operations, and one must cordially agree with Mr Bisdl Hughes that for such a case as partial thyroidectomy for toxic goitre a real advance in anaesthesia has been made.—I am, etc.,

London, N.W.1 Nov. 21st C. LANGTON HEWER

RESULTS OF TREATMENT OF CANCER

SIR,—In a letter to the *Journal* (October 11th, p. 621) pointing out the importance of *x* rays in the treatment of cancer I used the expression that "so far, the results of *x*-ray work in the treatment of cancer have been disappointing to the surgeons." I think that few surgeons will question the accuracy of the opinion, and none have done so. This statement has had, however, an unlooked-for effect, for radiologists have taken exception to it. Two genuine letters have appeared from Drs. Russell Green and Douglas Webster. If I interpret them aright, they wish to prove that surgeons should not be dissatisfied with the results of *x*-ray treatment, but I am afraid that very great improvement must yet take place before any medical man can be content with our treatment of cancer, for the results of all forms of treatment are deplorable.

If these gentlemen wish to imply that the surgeon needs educating as to the results at present obtained by *x* rays, perhaps they are right. The course seems very simple—let us get together and prove this to the disappointed surgeons, I am only too willing to side with the radiologists in the matter, but proof is, of course, essential. With this in view I have written to the secretary of the Electro-Therapeutic Section of the Royal Society of Medicine to suggest that the Section should hold a demonstration of cancer cases treated by *x* rays. It would, of course, be far more convincing if they were treated by *x* rays alone. I would suggest showing six examples each of cancer of the breast, the tongue, the rectum, and the cervix uteri. I think we might leave out skin cases. I would not even place a three years' time limit, simply let the cases be shown. The members of the Surgical and Proctological Sections should be invited to attend. I am led to believe from the letters that this material is available. I know that statistics are not very convincing, but if statistics are used, I suggest that as we have used *x* rays long enough in this country, we should produce some of our own figures. Joint discussions on this subject have been tried with, I fear, little success, but never has a clinical evening been arranged, and if it is held it will be far more interesting and convincing.

There is no need to continue this discussion in the *Journal*. It has already wandered far from the personnel of a radium clinic, let everyone interested in the subject write to Dr. Samsbury, the secretary of the Electro-Therapeutic Section, and offer his help. In this way we shall do something, try to prove something, and I hope carry conviction, and personalities, false quotations, and misrepresentations, which inevitably creep into medical controversy conducted by letter, will be avoided.—I am, etc.,

London, W.1 Nov. 18th DUNCAN C. L. FITZWILLIAMS

SIR,—In your issue of November 15th Dr. Heinaman-Johnson says: 'Statistics are beginning to be available in breast cancer with regard to surgery alone." It is important that the advance of radiology should not be held up by a barrage of fallacy, therefore I call attention to two sets of statistics relating to the surgical treatment of cancer of the breast. In the April number of *Acta Radiologica* Westermark has shown the following percentages free from recurrence after five years as the result of operation by four of the best-known Swedish surgeons: Dahlgren 15.0, Neander, 16.8, Brattstrom, 23.0 (1898–1915) 25.5 (1905–15), Nystrom, 20–23.0.

In the British Empire Cancer Campaign Committee's report for 1927 (p. 59), under the heading of "A statistical inquiry into the results of the operative treatment of cancer of the breast," the results obtained by a group of surgeons are thus stated: alive and well after 5 years, 40 per cent. Which of these sets of figures is accurate?

In the statistics quoted in the Campaign report, one fundamental fact is ignored—namely, the total number of cases operated upon. It is possible to obtain an indication of this figure for the period under review (1910–20 inclusive) as follows. The figures from three hospitals were taken as the basis for the Campaign report, which I designate Hospital A, Hospital B, and Hospital C.

	Breast Amputations	Due to Cancer		Period	No. of Cases
		Number	Percentage		
Hospital "A"	223	202	90	1910-14 (5 yrs.) 1914-20 (6 yrs.) say 2:2	401
Hospital "B"	During 1910–20 478 amputations of breast were performed; applying the 90% factor from Hospital A the number for cancer would be, say				433
Hospital C	No figures available but number of beds much larger than at either of the others with a correspondingly larger staff; it can safely be assumed that the number of operations for cancer of breast during 1910–14 would be not less than the average of the other two, say				417
	Total				1251

The Swedish statistics are expressed as the fraction number of five-year healings divided by total number operated upon.

Adverting now to the Campaign report. 541 cases only are reported on because "only cases in which the presence of cancer had been proved by a microscopic examination were included in the review", 507 cases were finally traced, of which 40 per cent. were five-year healings—that is, 203 cases—and, adopting this figure as the numerator, to the previously determined denominator, we obtain the fraction 203 over 1,250, or 16 per cent.—a figure more in consonance with those of the Swedish surgeons.

The fallacy of the Campaign figures lies in the fact that evidence more weighty than histological examination has been ignored—namely, the subsequent clinical course of the large majority, terminating in death. When, as in this case, less than half the cases are examined microscopically, the effect on the report is to include automatically all those cases which are so early as to need the microscope for their diagnosis, and to exclude those cases whose character is sufficiently advanced as to need no such confirmation.—I am, etc.,

Birmingham, Nov. 19th A. A. RUSSELL GREEN

ANTIMALARIA MEASURES

SIR,—The correspondence on the above subject had, I thought, ended, but the letter of Sir Malcolm Watson, published in the *Journal* of September 13th (p. 447) renders it necessary to re-state the issues.

So far as the references to myself are concerned I will confine myself to stating that the failure of Sir Malcolm Watson to take advantage, on the occasion of his visit to Lahore in 1924, of my offer to explain to him the local malaria problem and the efforts that were being made to solve it caused me no sleepless nights. It did, however, occasion surprise that a man who claimed to be an expert in malaria control should so little realize the imperfect state of scientific knowledge of malaria, and be so well satisfied with existing methods of control as to regard with disfavour any attempts to extend the scope of the one or to increase the efficacy of the other.

But to the real points at issue Sir Malcolm Watson has vouchsafed no reply. It is still not clear whether he has any practicable solution to offer of the problem presented by the control of rural malaria in the Tropics. It is true that he has told us that a knowledge of the mosquito-malaria cycle constitutes the key to the problem, but how this knowledge is to be applied on a large scale he has not attempted to explain. He claims, however, that by antimalaria measures "tens of thousands of lives" have

been saved in Malaya, but to the request that he should substantiate this claim there has been no response "Control," he states, "has spread from small towns to large towns, to estates, mines private undertakings and public works, villages, and many rural areas, and a great organization was created in 1926 to cover the whole country" Yet the principal medical officer of the Federated Malay States, in his last annual report, states that a study of the malaria death rate of the country as a whole during the past ten years, and of the four large towns during the past seven years, "reveals little progress in the mastery of the disease during this period"

Surely Sir Malcolm Watson owes it to science, as well as to himself, to place a detailed account of this great scheme in the hands of malariologists So far, then, as large-scale antilarval measures in rural areas are concerned, the measure of success achieved even in Malaya would at present appear to be equivocal And Sir Malcolm Watson has nothing else to offer He holds that diet, housing, and economic conditions are of little or no importance, and that quininization is almost useless If this, indeed, were a true picture of the position, there would be cause for pessimism, but fortunately this is not so Thanks to the steadily increasing knowledge of the epidemiology of malaria, the modern malariologist realizes that the control of malaria is not solely concerned with the minor problem of "species sanitation," but that it embraces a whole series of measures designed on the one hand to enhance the powers of resistance of the community and on the other to decrease the frequency of infection In self governing communities, where Draconian methods are impracticable, progress on these lines must necessarily be slow but it is on this account the more essential that unwise insistence upon any one measure and extravagant claims in regard to its value should not be allowed to obscure the issue, and to retard progress in a matter of vital importance to the well-being of millions —I am etc,

C A GILL,

Lahore Oct. 27th.

SIMPLE PHLEBITIS AND EMBOLISM

SIR,—In the *Journal* of December 1st, 1928 (p 1010), Dr O Hilton writing on this subject concluded by saying 'It would obviously save a great deal of nursing and worry if the three weeks with bed pans and so forth could be avoided It would be useful if others would record their experience and give evidence which would throw light on the problem of whether there is in fact, danger in a patient leaving his bed in such circumstances" It is in accordance with the wish expressed by him that I venture to send this letter to you in the hope that it may catch the eye of Dr Hilton and *save him further anxiety*

I would first ask, Does he inject varicose veins with any sclerosing solution If so does he put his patients to bed for three weeks to avoid embolism? A thrombus or clot is certainly formed in large veins in the legs, and to my mind there is just as much chance of a fatal embolism in these cases as there is in cases of simple phlebitis if a clot becomes detached yet the medical profession as a whole allow their patients to walk about after the operation without any anxiety or worry Has any case been recorded of embolism after an injection for varicose veins? I would next ask him why he keeps his patients in bed for three weeks—why not for six or eight? These patients often get successive thromboses and in fact the more they are kept in bed the more a thrombus is liable to occur so there is no limit to the time a patient may lose and to the needless nursing and expense incurred

It may be argued that the traumatic phlebitis caused by injection, and the phlebitis occurring without any recognizable cause are different in their pathology and require different treatment That the pathology is different I admit, but that in both cases it is safe to allow patients to walk about I hope to prove The traumatic phlebitis caused by a sclerosing solution whether salicylates, quinine or sodium morrhuate originates in an inflammation of the endothelium of the vein a deposit occurs at the site of the injection, and spreads to a small extent locally causing a hard thrombus Thrombosis due to stagnation follows, and a large section of the vein is blocked These clots do not cause emboli The disease recognized as simple phlebitis or thrombo-phlebitis migrans is the result of toxaemia, either acute or chronic Examples of acute thrombo-phlebitis are those which occur during pregnancy or after labour, in enteric fever, and post-influenzal infection or septic tonsilli is In other cases they are usually the result of chronic auto-infection, generally due to intestinal toxaemia

The result of researches made, and published in the *Journal* about two and a half years ago, proves that no organism is grown from the blood—in other words there is no general septicaemia, and the clot is sterile It is on account of the result of the infection on the protein particles in the plasma that clotting or thrombosis occurs as has so often been pointed out by McDonagh From the nature of the changed blood condition it is evident that a precipitation can occur in any vein in any part of the body, and this accounts for a thrombosis in the lung causing so-called pulmonary embolism It is not that a clot has travelled up a vein to the right side of the heart, but a primary focus has occurred in the lung Sometimes the affection in the lung is primary without any thrombus in the veins of the leg

If space permitted I could quote twelve cases which I have treated (with complete and rapid recovery) during the last four years on the lines advocated by McDonagh They have never been put to bed, and have had no embolism The routine treatment of putting patients to bed is probably the worst possible, as it allows local stagnation and increased toxaemia due to loss of elimination It requires some courage to depart from the shibboleths handed down from ancient times but if Dr Hilton is courageous enough to tell his patients to take up their beds and walk, he need have no sleepless nights wondering whether he will lose his patient or attend an inquest The patients will be more than grateful —I am etc,

W W JEUDWINE.

Newport I W Nov 22nd.

PARTURITION PER PERINEUM

SIR,—I was much interested to see the illustration accompanying the case described as 'Parturition per perineum' by Drs Tindal and MacLennan in your last issue (p 863) This is undoubtedly a case of central rupture of the perineum under an unusual title The condition is described in *Queen Charlotte's Practice of Obstetrics* (p 377) with an illustration on page 379 The illustration in the textbook, however, is of the lateral type of rupture

A colleague Dr W M Sadler of Slough fifteen years ago had a case which would undoubtedly have ended in the same way He noticed that the perineum became very thin and blue at a point just anterior to the anus and that the foetal head did not advance towards the vaginal orifice He performed an episiotomy and the child was delivered per vaginam (*in extensis*)!

Drs Tindal and MacLennan are to be congratulated on having secured a photograph of their case —I am etc,

The Services

29TH GENERAL HOSPITAL DINNER.

THE twelfth annual reunion dinner of the medical officers of the 29th General Hospital will be held at the Trocadero London on Saturday December 6th Lieut.-Colonel S H Withers C M G P A M C (ret) will preside The honorary secretary is Captain A Percy Groves Hermonfield Meadow court Road, Leicester

DEATHS IN THE SERVICES

Lieut Colonel Edward Mulvany Bengal Medical Service (ret) died at the Hotel Brice Nice on October 27th aged 80 He was born on November 21st 1849 the son of Mr Michael Mulvany of Thurles was educated at the Catholic University of Dublin and took the L.R.C.S.I in 1871 and the L.K.Q.C.P in 1872. Entering the I M S as assistant surgeon on March 30th 1872 he became surgeon on July 1st 1873 when the rank of assistant surgeon was abolished, attained the rank of surgeon lieutenant-colonel after twenty years service and retired on July 11th, 1892.

Universities and Colleges.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

Annual Meeting of Fellows and Members

The annual general meeting of the Fellows and Members of the Royal College of Surgeons was held on November 20th, the chair being taken by the President Lord Moynihan of Leeds About seventy Fellows and Members attended

The President laid the annual report of the Council before the meeting, and drew attention to some of the matters reported therein He said that the primary Fellowship examination had been again held in Canada, and next year would be held in Australia also The first examination for the diploma in gynaecology and obstetrics had been held, there had been five candidates, of whom one had passed Dr E E Ware and Professor F Wood Jones had been elected Fellows under Section V of the Charter The honorary gold medal of the College had been awarded to Professor G Elliot Smith in appreciation of his services to the Museum The final Fellowship examination had been passed by 88 candidates, as compared with 72 last year The Lister Memorial Lecture had been delivered by Dr Harvey Cushing of Boston, who had at the same time unveiled a silver tablet to the memory of Sir Anthony Bowlby, erected by the medical officers of the American Expeditionary Force who had served under him in France A sum of £4 000 had been spent on research laboratories Thanks to the munificence of Lord Beaverbrook, Lord Melchett, and Sir Louis Baron, the College could now offer three scholarships of £500 a year each The College, however, still required £100 000 to build and equip a surgical research institute to work in conjunction with the new laboratories, for there was at present no place in the British Empire where surgical research could be conducted

Dr Richard Gillbard asked what sums had been received for the Membership and Fellowship examinations during the past year

Dr David Roxburgh thought that the result of holding examinations in Canada and Australia must be to degrade the examination The standard of an examination was determined not by the examiners but by the candidates It was unreasonable to hope that the standard of teaching in Australia and Canada would approach that in London He thought the expense of sending examiners over there would be better directed to enabling candidates to come over to London for the examination

The President replied that the expenses of the Membership examination had been £18 085, leaving a balance of £5,692, the Fellowship expenses had been £6,736 leaving a balance of £2,325 The question of holding examinations in the Dominions had been very fully discussed by the Council, and they had decided that it would be to the advantage of the College and of surgery in general to hold examinations in Canada, provided that the right kind of examiner could be sent out and the right kind of machinery provided for the examination

Representation of Members on the Council

Dr F F Ware moved the usual resolution in the following form

> That this forty second annual meeting of Fellows and Members of the Royal College of Surgeons again affirms the desirability of admitting Members, who constitute nine tenths of the College roll, to direct representation on the Council of the College
>
> That the result of the recent poll of Members resident in the United Kingdom and the Irish Free State (taken by the Society of Members in response to reply of the Council December 12th 1929), which is as follows

Cards sent out	12,766
Cards returned undelivered	166
Cards not valid	58
In favour of representation	6,832
Against representation	156
Majority in favour	6 676
By personal canvass in favour	106

> provides indisputable evidence that this change in the constitution of the College is desired by a very considerable number of the Members of the College

He remarked on the antiquity of the form of resolution, and ascribed this to the fact that it expressed a just claim which appealed to all who could think logically Only recently had it been passed with a feeling of good will and amity, but there was no reason for rancour, it was simply a matter of difference of opinion The President had said last year that there was no evidence that this measure was desired by more than a few members Since then several favourable references had been made to the proposal by the Council, the Hunterian Orator, and the journals The funds collected had not been sufficient to take a poll of all the Members, only practising doctors with permanent addresses had been circularized Of the seven thousand who had sent valid replies, only 156 were against the necessary change in the Charter It was proposed that a certain number of Members only, elected by Members alone, should be added to the Council These figures offered indisputable evidence that the change was desired by a large number of Members

The resolution was seconded by Mr Windham L Gillbard who said he was astonished to find that this proposal had been before the Council for so long, although no convincing reasons had been adduced for its rejection On this matter 55 per cent of those addressed had voted—a remarkably high figure for a postal vote among doctors This showed that the Members were more interested in the management of the College than the Fellows Fellows abroad showed great interest in the College, and it was reasonable to suppose that Members abroad would also show this interest It was not good for the College that its Members should regard it as an examination machine with a museum somewhere in the neighbourhood of Lincoln's Inn Fields

Dr F W Collingwood said that the rank and file of the medical profession did a great national work These general practitioners should have a status of which they were not ashamed Dr Haydon also supported the motion

Mr McAdam Eccles asked whether the voting card was accompanied by a letter, what wording had been used and whether it had been stamped (A copy of the card and circular was handed in)

Dr Wilson Parry said that from the legal point of view the Members had no case but the law had its limitations He appealed to a tribunal respected and revered by every medical man—the system of ethics embodied in the Hippocratic oath—and the basis of this system was ethical justice Mr Howard Stratford suggested that it would be pleasant if the visitors to London from all over the world on the occasion of the Centenary Meeting of the British Medical Association in 1932 could learn that Members had been given a part in the management of the College Dr Richard Gillbard said that the atmosphere was very different from that of former meetings Members were hopeful and he trusted that this meeting would not come to an end resembling that of the last chapter of Rasselas—"a conclusion wherein nothing is concluded" Dr Kite said that there was no personal feeling, this was a matter of principle

The President said that the resolution had never been submitted by such temperate, eloquent, and fair minded speeches as on this occasion The Council regarded this as a matter for most anxious consideration, and it had never been decided with ill will or disregard In view of the figures submitted by Dr Ware, the Council had decided to hold a special meeting in committee before the next full meeting to discuss this matter *de novo* (Applause)

The motion was carried by 43 votes to 1

UNIVERSITY OF OXFORD

At a congregation held on November 22nd the following medical degrees were conferred

D M—T C Hunt O R Tisdall

B M—J N O Reilly

UNIVERSITY OF LONDON

Lectures in the History of Medicine

Two lectures, illustrated by lantern slides, will be delivered at University College Hospital Medical School, University Street, W C by Dr Charles Singer, on Mondays December 1st and 8th, at 4 15 p m The subject of the first is the "Fourth centenary of the invention of the word 'syphilis,' and of the second "The eighteenth centenary of the birth of Galen" The lectures are open to all medical students of the University of London

SOCIETY OF APOTHECARIES OF LONDON

The following candidates have passed in the subjects indicated

Surgery—E Jacomb L A Riddell W K Schnarr

Medicine—R P Davies L A Riddell W K Schnarr

Midwifery—S I Bellgard G I Benjamin C L Ferguson W G Kingston P H W Lyle M S Myles H C Tain

The diploma of the Society has been granted to Messrs P P Davies and L H W Lyle

Obituary

DAME MARY SCHARLIEB D B E H D, M D, M S,

Consulting Physician for Diseases of Women Royal Free Hospital

Dame Mary Scharlieb (nee Mary Ann Dacomb Bird) was born on June 18th, 1845 near London and her mother died ten days later The care of this delicate baby devolved upon the maternal grandparents, but after some years her father married again and it was owing to the stepmother's influence that she received an education that was unusually good for the time At the age of 10 she was sent to a boarding school in Manchester, and while there wrote a story about a child in India This was permitted as a substitute for the daily 'copy," and was her second flight as she had already written a thrilling and tragic tale at the age of 5 Her health being somewhat unsatisfactory, she was moved to a school at New Brighton where she revelled in nature studies and collected seaweeds and zoophytes The third educational venture was to a school in St John's Wood, where she entered enthusiastically into the science language, and literature lessons, besides making progress in music under the tuition of her beloved cousin Henry Bird She was fond of riding but never joined in games and detested dances and parties Before she was 20 she had met Mr Scharlieb who was visiting friends in England and "eating his dinners" at the Middle Temple, preparatory to being called to the Bar The attraction was mutual and in spite of objections from all her relations she coaxed her father round They were married on December 19th, 1865 and soon after sailed for Madras At the end of 1866 her first son was born and two other children followed in 1868 and 1870

Mary Scharlieb

Twelve years were spent in the ordinary routine of domestic cares and duties, combating ill health in a tropical climate and oftentimes uncongenial surroundings She helped her husband in the publication of two law journals and in his work as an examiner It fell to her lot to review Sir Joseph Favrer's *Medical Jurisprudence* and this first aroused her interest in medicine There came to her knowledge also through her husband's clients and clerks, many cases of suffering among Hindu and Mohammedan women and she became convinced of the necessity of women being qualified to attend on them So she obtained permission to enter the Madras Lying-in Hospital for a year's training This she found was not enough, and after much delay and opposition she entered the Madras Medical College with three other women They shared the instruction with the men who were preparing to be surgeons in military and civil employ, and at the end of three years all received the licenciate in medicine, surgery, and midwifery But the hard work involved had so told on her health that a return to England was inevitable It was also necessary to take the children home for the sake of their health and education

The voyage home was a nightmare of horror The ship ran out of coal four times, but in spite of peril illness (aggravated by the smell of the oilseed cargo), and the supervision of the children, she ensconced herself in a recess of the saloon with back to the wall and feet firmly planted against the side of the chimney and fought nausea and mathematical riddles at the same time, and thus prepared for an entry as expeditious as possible to the London Matriculation Letters of introduction to Mrs Garrett Anderson Sir Henry Acland Florence Nightingale and others were presented, and she entered the School of Medicine for Women passing the Preliminary Scientific in 1879 In 1880 she began work in the wards of the Royal Free Hospital and took the final M B the following year, gaining the gold medal and scholarship in obstetrics In January 1883 she decided to go to Vienna to obtain practice in operative midwifery and again her perseverance and determination overcame all obstacles, and she obtained real dexterity in this branch of surgery She attended clinics for diseases of the ear and eye

scorning delights and living laborious days"

At the end of two months he met her husband in Italy and together they returned to England Then followed audiences with Queen Victoria and the Prince and Princess of Wales Queen Victoria insisted on hearing all details of the difficulties and sufferings of the caste and gosha women She listened with the greatest interest, and said How can they tell me that there is no need for medical women in India' She then gave her a message for her future patients

Tell them how deeply their Queen sympathizes with them, and how glad she is that they should have medical women to help them in their time of need'

On her return to Madras in July 1883 she started work as a general practitioner, but soon realized the absolute necessity of a hospital, not only for the poorer patients, but for those of good family whose households included no one capable of carrying out instructions As for colleagues there was no one nearer than Bombay so she taught her sister to administer anæsthetics and her maid to assist to the best of her ability The Government soon came round to a realization of the necessity for a hospital, and this materialized as the Royal Victoria Hospital for Caste and Gosha Women Her days work at this time began at 5 30 a m and continued till the dinner hour at 8 p m Then sleep and bed if possible, but that was frequently interrupted by night calls, and the most trying part was that no matter how ill or over-fatigued she might be she felt she could not rest without causing damage not only to individual patients, but to the work she had set out to do—namely, the teaching of the women of the country to rely on and to use the help that Western

medical knowledge could give them Fortunately an assistant was soon forthcoming, and then she was able to accept the post offered of lecturer on midwifery, gynaecology, and diseases of children at the Madras Medical College She was also appointed examiner in obstetrics and gynaecology to the University of Madras

In February, 1887, she left Madras, never to return She had built up a good practice, earning about £2,000 a year, but heavy expenses had made saving impossible, and now she was faced with the double problem of failing health and the urgent need to earn in order to redeem liabilities undertaken in days of prosperity Mrs Garrett Anderson received her kindly, and put a certain amount of work in her way She became joint lecturer on medical jurisprudence to the School of Medicine for Women, and also physician to out-patients at the New Hospital for Women then in its very early days In February, 1888, she was appointed clinical assistant to Mrs Garrett Anderson, and later was elected president of the University of London Women Graduates' Association In December she obtained the M D degree of London, being the first woman to secure it The following year she accepted the lectureship on the diseases of women at the School of Medicine In 1890 Mr Scharlieb returned to England, but two months later he succumbed to influenza and pneumonia, and died on January 4th, 1891

The period between 1891 and 1902 represents a sort of tableland She had as large a practice as she could manage She was a hospital surgeon and lecturer at the school, and had various outside appointments She was medical referee for most of the big missionary societies whose headquarters are in London, lecturer to the Queen's Nurses and other institutions, as well as examiner to women candidates for the Civil Service A landmark during this period was her achieving the degree of Master of Surgery in 1897 In 1902 came the appointment as gynaecologist to the Royal Free Hospital, which made her the first women to hold a staff appointment in a London general hospital The lectureship on midwifery was also added to that already held at the School of Medicine for Women, and this post she retained until 1908

The next ten years brought but little change in the record of professional life Several books were published, a bad attack of appendicitis weathered, and delightful holidays abroad are recorded In 1910 she was president of the Section of Obstetrics and Gynaecology at the Annual Meeting of the British Medical Association, having served as vice-president in 1900 In 1913 she was appointed to serve on the Royal Commission on Venereal Diseases, and with other members of the committee joined the newly formed National Council for Combating Venereal Diseases She was also a member of the Commission on the National Birth Rate, which began its sittings in 1913, and presented its first report in 1916 and its second in 1920 During the war her health forbade her accepting the offer of the charge of one of the women's hospitals in Belgium, but she did a great deal of voluntary work serving on the Council of War Relief for the Professional Classes, attending the patients in the maternity hospital, and lecturing on venereal diseases and rescue and preventive work

In August, 1917, the King conferred on her the honour of the C B E, and in the same year she was elected to the presidency of the London (Royal Free Hospital) School of Medicine for Women In 1924 she presided at its jubilee dinner at the Guildhall For many years she was Deputy Chairman of Convocation and until her death she represented the Standing Committee of Convocation on the Royal Institute of Public Health London University The Congress in 1920, and she was president held a congress in Brussels in 1 was appointed one of the of the Women's Section Shortly the juvenile court under first women magistrates, serving in Holloway also one of the Commissioners in Lunacy Mr Campbell Graham She was for 26 she was created visiting magistrates at Holloway Prison In 1925 Dame of the British Empire, and two years later the honorary University of Edinburgh conferred on her degree of LL D Two notable papers read but must not be forgotten the Norman Kerr Lecture before the Society for the Study of Inebriety in 19

one on "The family the spirit in the Christian home," contributed to the Anglo-Catholic Congress in 1923, when her clear voice and perfect diction could be easily heard all over the Albert Hall The last three years of her life were spent in the house of her son, who is senior anaesthetist at University College Hospital

Dame Mary Scharlieb's personality was no less remarkable than her life story Her appearance was characteristic and unforgettable, with her upright carriage, her hair still dressed in the fashion in which she wore it in the days of Queen Victoria, her bonnet now almost a relic, even for old ladies, and her wonderful hazel eyes full of intelligence, which never lost their youthful sparkle up to the last days of her illness Almost to the day of her death her mind remained clear and active, and her will power was as strong as it had ever been It was that perhaps more than any of her other remarkable qualities which made her what she was, enabling her to overcome difficulties which any other man or woman would have found insurmountable Her energy was inexhaustible Her usual hour for operating was 8 a m, the beginning of a day which seldom ended before 10 p m She was extraordinarily versatile, her interests ranging from women's welfare and journalism to domestic affairs and surgery She was performing major operations two years ago, and kept herself absolutely up to date, worked with amazing rapidity, sometimes making it difficult for her assistants to keep pace with her All new movements for social progress had her active support She was interested in all that made for the betterment of her fellow creatures, especially of women

She was a woman of deep religious convictions, untouched by modern scepticism Her sense of humour never failed, nor was she ever at a loss for an apt quotation or a quick repartee Through her profound knowledge of human nature there ran a deep vein of sound common sense, which well equipped her for dealing with the mental as well as the physical difficulties of her patients Even up to the day of her death patients were wanting to consult her, scarcely believing it possible that she could no longer be accessible to them Patients and friends alike can hardly realize that her indomitable personality has gone Hers is a spirit that has left its mark in a world of suffering humanity in a way that she herself would have wished A favourite quotation of hers may fitly close this memoir, contributed by three friends

"The day is long and the task is great, the reward also is great and the Master presseth It is not incumbent on thee to finish thy work, but thou must not cease from it"

We are indebted to Sir THOMAS BARLOW, Bt, for the following appreciation

During what may be called the middle period of the struggle for the medical education and recognition of women, the Children's Hospital in Great Ormond Street gave facilities to women students to attend the clinical work of the hospital I have a vivid recollection of Mrs Scharlieb's first attendance at my clinic more than forty years ago along with some of her fellow students She had gone through a medical course at Madras, supplemented by a fair amount of practical work, and had come to England for further medical education with the determination to obtain the best qualifications then open to her I was very soon convinced that she was no tyro in methods of physical examination, and by and by I realized that she was a person of decision and purposefulness She was at that time working for the final examination of the M B degree of the University of London She took her degree, gaining the gold medal in obstetrics and honours in other subjects She broadened her knowledge of gynaecology by a course of study at Vienna, and ultimately obtained the London M D and M S She then returned to India and gave herself up to hospital work on behalf of poor and outcast Indian women Hard work led to some failure of health, and eventually she returned to England and entered on private practice in London, devoting herself largely to operative gynaecology I am assured by those whom I can trust that she gained considerable manipulative facility, and she certainly obtained very good results From this time for a while I saw little

of her, but I could not fail to admire her tenacity in pleading for freedom of opportunity for women in medical education. She had not only courage and singleness of purpose but moral fervour in her many undertakings. She spoke with no uncertain sound about alcoholism and medical missions. She was appointed a member of the Government Commission on Venereal Diseases, and for many years she was a working member of the committee for combating those diseases especially during the war. In spite of her pioneer spirit, Mrs. Scharlieb could not be described as an aggressive personality. She was courteous, tolerant, and reasonable. She was distinguished by her readiness and sympathy, and she had a way of inspiring patients with her cheerful and buoyant courage. I can bear witness that as a colleague she was loyal, fair, and generous. She lived to a good old age, and her distinguished career received proper recognition. She rejoiced in the love and attachment of her children, and in the warm friendship of her fellow workers, and they will remember her as a woman of great attainment, of noble purpose, and of singular courage and devotion to principle.

Dr. JANE WALKER writes:

It is perhaps fitting that Dame Mary Scharlieb's oldest living friend among the woman doctors should endeavour to give the readers of the *British Medical Journal* some idea of her. I first made her acquaintance in the spring of 1880. She had recently come from India to put her three children to school in this country, and to pursue her medical studies with a view to obtaining an English degree. The Senate of the London University under the able chancellorship of Lord Granville, had opened the doors of all its examinations to women, and accordingly Mrs. Scharlieb decided to work for the London M.B. Another woman, Miss Edith Shove, was in much the same position, both had some years of medical study behind them, and were really in a position to sit for the first M.B. examination. They applied to be excused from the matriculation and the preliminary scientific examinations, and their application was granted. I believe I am right in saying that this permission was coupled with the *sine qua non* that they should both pass an examination in Latin for their final M.B.! The successes of both these ladies were brilliant and outstanding, and perhaps it is largely owing to their example that the students of the London School of Medicine for Women have always been very numerous in the lists of the medical and surgical examinations at the London University. Mrs. Scharlieb was a very brilliant student both at the school and at the Royal Free Hospital, which had opened its doors to women students of medicine at about the same date as the London University. She and I saw a great deal of one another, although I was at the school and she at the hospital. For one thing, I could get off more easily than she could, and as she had her children on her hands, I and her other three great friends at the school and hospital—Julia Cock, Constance Hitchcock, or Helen Prideaux—used to help her with them by seeing them across London to their schools and in other ways. Another reason was that she was in-patient clerk to Dr. Buchanan Baxter, and I was his out-patient clerk. We both regarded ourselves as among the luckiest people in the world, for he was a truly great man and a magnificent physician. Mrs. Scharlieb returned to India in 1883 and practised in Madras where he was lecturer in midwifery and gynaecology in Madras Medical College and examiner. She was also medical superintendent to the Hospital for Caste and Gosha Women. But she had never been strong, and the climate of Madras together with the hard work of a big practice made it impossible for her to continue in India, and so she returned to London in 1887 to that house at the top end of Harley Street which she shared at first with Professor Schafer, another of our very great and dear friends at the School of Medicine, and where her numerous friends, both medical and lay, and an ever increasing number of patients, knew her till 1924 when the house was pulled down. All her friends were welcome; she was the soul of hospitality and of unbounded generosity, and she gave in all ways of her substance far beyond the traditional tithe.

Several obituary notices have called her a pioneer. In my opinion this is an incorrect description of her. Rather did she become a woman doctor to enable her to help the sufferings of her fellow women. In no sense did she attempt to blaze the trail for medical women coming after. She was a most beautiful operator, but it was all done in such a quiet, modest, unassuming, almost commonplace manner that it seemed, even at the very beginning, to be the most ordinary thing in the world for a woman to be doing big abdominal surgery. It is, of course, true that delicacy of touch and the smallest of hands, as well as knowledge and practice of needlework, were a great asset—(whoever has seen Mrs. Scharlieb quietly knitting at a committee of both men and women could doubt that)—but she had never had an operating knife in her hand till she was turned 40 years of age and yet very soon she became one of the six great abdominal surgeons of the world. That, I think, makes her almost of the nature of a phenomenon. She brought ordinary common sense and naturalness to all she did. She had no peculiarity, she dressed just like other people at a time when all sorts of extravagances were being used in a serious attempt to help "the Cause." All this was of inestimable value at that time in the women's movement. Indeed I should not call her a feminist, at any rate not in the really modern use of the term. She helped the women's movement in what is perhaps the really best way by the excellence of her work. It was not until the latter part of her life that she became a keen suffragist and she was greatly disturbed by what she felt were the excesses of the militants. In spite of Mrs. Scharlieb's delicacy of constitution, she was a tremendous worker although always in a very orderly and methodical way. She was invariably up to time—you could set your watch by her movements—and she never hurried. Her habits and tastes were of the simplest; her own personal requirements very small, her own meals of the frugalest; some would have said sparse; and ten o'clock at night always found her preparing for bed—usually in her bath. Even there she was at work for she did her meditation there.

No notice of Mary Scharlieb would be complete without some reference to her religious faith, for it dominated her whole life. She was a consistent practising High Churchwoman and a member of the Church of St. Mary Magdalene, Munster Square, during the whole time she lived in London.

Dr. LOUISA GARRETT ANDERSON writes:

The name of Mary Scharlieb holds an honoured place among medical women and her passing marks the end of an epoch. Mrs. Scharlieb followed the early pioneers such as Sophia Jex-Blake, Edith Pechey Phipson and my mother, but although their junior she was sufficiently near them in age to share many of their labours, responsibilities and difficulties. She was a loyal and devoted colleague, and to her more than to any other woman is due the credit of establishing a high standard of surgical work among women practitioners. In 1885 during my mother's absence in Australia, Mrs. Scharlieb took charge of the Women's Hospital, which was situated then in the Marylebone Road. When the hospital enlarged and removed to Euston Road she became senior surgeon, a post she held with distinction for many years. She was a courageous and successful surgeon and her manipulative skill was great. Her surgical reputation was an immense asset to the medical women's movement, especially in its early days when inability to deal with important gynaecological surgery would have been disastrous. Mrs. Scharlieb's association with my mother was a very happy one. In most respects very dissimilar, they were good friends and excellent colleagues. Mrs. Scharlieb's generosity and genuine kindness won intense devotion from her patients of all classes. To the world the name of Mary Scharlieb is better known than that of any other medical woman; it has been familiar for half a century. Medical women are proud of all she did and of the record of her life. She has left them an example of splendid professional and public service.

G H K MACALISTER, M D,

Principal and Professor of Clinical Medicine, Singapore Medical College

We regret to record the death of Dr George Hugh Kidd Macalister, who died in London on November 2nd, after a long illness. The son of Alexander Macalister, professor of anatomy at Cambridge, Hugh Macalister was born in Dublin in 1879, where his father held the chair of anatomy at that time. After an early education at the Perse School, Cambridge, and at Bonn, he obtained a scholarship at Charterhouse, and afterwards at St John's College, Cambridge, thence he went to Guy's Hospital, and, graduating M B, B Ch in 1906, he held several resident appointments. His inclinations, however, led him to the laboratory rather than to practice, and, taking the M D and D P H in 1909, he served in succession as assistant bacteriologist at Guy's Hospital, the Lister Institute, and the Wellcome Research Laboratories. Whilst holding the latter post the death of his first wife struck him so deep a blow that he decided to leave England, and in 1914 he went out to India as pathologist to the Imperial Bacteriological Laboratory at Muktesar. There he spent much time in field work, and published a monograph on kumri, but the war interrupted his work, and in 1916 he went to Baghdad with a temporary commission in the Indian Medical Service, and took charge of a large pathological laboratory. In 1917 he received an offer from the Colonial Office to go to Singapore as principal of King Edward VII Medical School. This gave him the opportunity he wanted, and in 1918 he took up the post that was to provide him with the outstanding work of his life. The steady progress of the school, now the College of Medicine, under his guidance, and the replacement of the old building by the impressive structure of to-day, are an enduring monument to the patient care, the skilful administration, and the tactful enthusiasm with which he tended its growth. In addition to his work as principal he also held the chair of clinical medicine, and he entered into many activities in medical life, he was president of the Malaya Branch of the British Medical Association, and secretary of the Straits Settlements and Federated Malay States Medical Council. Yet it will not be for his official activities so much as for the high ideals which he inspired that he will be remembered and honoured for many a year throughout Malaya. In 1927, during a period of leave, he was Government representative at the League of Nations Conference on Rabies in Paris, and later he went to Sierra Leone as a commissioner to advise on subordinate medical education; in this year also he was elected a member of the Royal College of Physicians.

Quiet and reserved by nature, Hugh Macalister seemed, perhaps, to the casual observer to be somewhat difficult of approach; but when once the ice was broken there lay revealed a depth and tenderness of affection that made him the rarest of friends. No account of his life would be complete without some reference to his second marriage, which took place in Bombay just before he set out for Singapore, for this alone made possible the success that he achieved. No longer did he picture himself an exile, his home went with him, and from it there radiated a happiness that not only made his own life complete, but also contributed in large measure to a beneficent influence that spread throughout Malaya. The sympathy of a wide circle of friends will go out to Mrs Macalister and her children at his early death.

Dr Edwin Gabriel Harris, who died on November 5th, at the early age of 38, received his medical education at the London Hospital, and obtained the diplomas M R C S, L R C P in 1917, having served as surgeon probationer in the Navy during the earlier part of the war. After qualifying he held the posts of house-physician, house-surgeon, resident anesthetist, and clinical assistant in the anal and genito-urinary departments of the London Hospital. He had also made a special study of ophthalmology and was clinical assistant in the ophthalmological department of the London Hospital, and refractionist at the Peckham Treatment Centre of the London County Council. Dr Harris was a Fellow of the Hunterian Society, and a member of the British Medical Association and of the New Cross Medical Society. In 1922 he joined Dr R Tilbury in practice in Peckham, and won wide spread popularity by reason of his conscientious work and great capacity for friendship. He leaves a widow and an infant son.

Medical Notes in Parliament.

[From our Parliamentary Correspondent]

The House of Commons has been in committee on the Education (School Attendance) Bill. Sir Charles Trevelyan announced that the Government would propose that the operation of the measure should be postponed till September 1932. A debate on the recent Imperial Conference arose on November 27th.

On November 25th the Parliamentary Medical Committee was addressed by Dr Blacker and Dr Langdon Brown of the Eugenics Education Society, on voluntary sterilization of the unfit. A discussion followed, and questions were asked, but no resolution was proposed. The Medical Committee authorized Dr Salter and Mr Somerville Hastings to see Mr Greenwood on the proposal to establish a consultative committee on rheumatism.

The Socialist Medical Association met at the House of Commons on November 19th, and decided that it would offer to collaborate with any other association having similar aims. The National Medical Service Association issued, on November 25th, its observations on the British Medical Association's proposals for a General Medical Service for the Nation.

Regulations under the Mental Treatment Act have been circulated by the Ministry of Health to local authorities, and are to lie on the table of the House of Commons, probably after the Christmas recess. Their acceptance is anticipated by the Government, which regards them as being merely consolidatory.

After-career of Mentally Defective Children

Mr Morgan Jones, replying to Major Church on November 24th said that the Board of Education urged all local education authorities which provided schools for mentally defective children to compile records of the after-careers of children who had left, so far as they were able. Nearly all authorities did so but they were not in a position to ensure that those records were complete. An analysis of the records for seven areas would be found in Para. 88 of the report of the Board's chief medical officer for 1925.

Bellahouston Hospital

Replying to Mr McLean, on November 20th, Mr Roberts said repeated intimations had been received from the Glasgow Corporation that the site of Bellahouston Hospital was required for civic purposes, and, though they had extended the Ministry of Pensions occupation on several occasions it was decided that existing requirements did not justify further occupation beyond January next. He was satisfied that Erskine House was entirely suitable as alternative accommodation for the treatment of ex-service men in the West of Scotland, and saw no ground for altering this decision. Erskine House was not a Ministry of Pensions hospital, but was controlled by a governing body of Glasgow citizens, with which the Ministry had for many years had an arrangement on a capitation basis for the care and treatment of medical and surgical cases arising from war disability. He was unaware of any departure from the purpose for which the hospital was established. Ministry patients had been treated in this hospital for years past. The number of beds at present available for the Ministry at Erskine House was sixty-three. During the years 1925–29 limbless and other surgical cases were treated in the Ministry of Pensions surgical centre at Bellahouston, which would shortly be transferred, under the present surgical control, to Erskine House. The number of equipped beds in Bellahouston was seventy-two, and the numbers of in-patients treated during the years 1925 to 1930 were respectively 277, 226, 167, 129, 101, and 93. About 300 out-patients commenced a course of treatment during 1925 and about 100 during the early months of 1926. Since 1926 the out-patient branch of the work had been transferred to Sauchiehall Street, Glasgow, where it was at present, and would henceforth be conducted.

Bodies for Dissection

Mr Greenwood stated in reply to Mr Day on November 20th that his attention had been drawn to the fact that the public assistance committees of several counties had decided that

in future bodies of friendless paupers were to be available for dissection at medical school but arrangements were made by the authorities that when the dissected body was buried the remains of the body would be properly interred Any inmate of an institution might express a desire that his body should be interred without anatomical examination and Section 7 of the Anatomy Act 1832, provided that such a wish would be respected

Tuberculosis on Tyneside.—In reply to Mr Edge on November 20th Mr GREENWOOD stated he was in communication with the authorities of South Shields concerning the prevalence of tuberculosis in that borough He had made suggestions for increasing the hospital provision available for treatment of tuberculosis on Tyneside If local authorities desired a conference with a view to a centralized and comprehensive scheme he would be glad to do anything to facilitate it

Death Certification in absentia.—Mr GREENWOOD said in answer to a question on November 20th that his attention had not previously been drawn to a statement by the Southwark coroner to the effect that there were thousands of doctors who would certify death without seeing the body of the deceased A the subject was fully discussed during the passage of the Births and Deaths Registration Act of 1926 he did not see sufficient reason to introduce legislation making it imperative for doctors to see the deceased persons before death certificates were issued

Advertisements in Medical Periodicals.—Replying to Mr Freeman on November 20th Mr GREENWOOD said he was unaware of any ground for proposing to extend by amending the Medical Act of 1886 the control which he understood was already exercised over advertisements of drugs by the proprietors of medical journal

Suicides.—Mr SHORT told Mr Kinley on November 20th that the number of suicides in England and Wales in the years 1920 to 1929 were respectively 3,573 3 715 3 844 3 919 3 679 4 054 4 408 4 863 4 846 and 4 907

Absinthe.—Mr SHORT said in reply to Major Owen on November 20th that he was not prepared to introduce legislation forbidding the manufacture sale, and use of absinthe in this country

Poisoning by Lead Paint.—Replying to Mr White on November 20th Mr SHORT said that since the new regulations under the Lead Paint Act came into force on October 1st 1927 there had been 87 cases reported including 20 deaths in 1928 75 cases including 10 deaths during 1929 and during the nine months ended in September 43 cases including 9 deaths The regulations were constantly under review having regard to the facts in cases brought to notice

Experiments on Animals.—Replying to Mr Freeman on November 19th Mr SHORT said the cost of keeping a record of the number of animals involved on the basis of the 403,141 experiments for purposes of vivisection performed last year would depend on the amount of detail required to be collected and tabulated and the degree of completeness to be attained in the collection Additional clerical assistance would be needed in any case and the inspectors would have to give a certain amount of the time which at present was available for inspection

Mental Treatment.—Replying to Mr Kinley on November 20th Mr GREENWOOD said that the method of treatment of patients in public mental hospitals was not laid down by the Board of Control but was within the discretion of the medical officer of an institution

Asylum Officers' Superannuation.—On November 20th replying to Mr Rambotham Mr GREENWOOD said the decision to set up an actuarial investigation into the Asylum Officers' Superannuation Act of 1909 was taken in September 1929 and the intervening period had been occupied by the collection of necessary data from the institutions concerned The returns received were before the Government actuary who would carry out the investigation as quickly as possible This would occupy a considerable period and it was not practicable to fix a date for its completion

Medical News.

DR T WATTS EDEN has been appointed chairman of the directors of the *Journal of Obstetrics and Gynaecology of the British Empire*, in succession to the late Sir Francis Champneys

THE annual dinner of the Medico-Legal Society will be held under the presidency of Lord Riddell at the Holborn Restaurant on Friday December 12th at 7 15 p m The honorary secretary is Mr Ernest Goddard, 3 South Square, Gray's Inn W C 1

THE Irish Medical Schools and Graduates Association will hold its annual London dinner in the Georgian suite Piccadilly Hotel W on Thursday December 4th at 7 45 p m The president Dr W Player Kennedy will take the chair and the guest of the association will be Lieut Colonel Sir Frank O Connor Tickets (price 15s exclusive of wines) can be had from Mr James Carver F R C S St George's in the East Hospital The dinner will be preceded by a general meeting of the association at 7 15 p m

THE winter dinner of the Australian and New Zealand Medical Association in England will be held at the Trocadero Restaurant on Friday, December 12th at 8 p m Mr T P Dunhill will preside and the High Commissioner for Australia will be the official guest All medical visitors from Australia and New Zealand whether members of the Association or not are invited to be present The honorary secretaries are Mr E T C Milligan and Mr Philip J Jory, 26, Queen Anne Street, W 1

THE annual dinner of the Yorkshire Association of Graduates of the University of Glasgow will be held in the Great Northern Hotel, Leeds, on Friday December 5th at 7.30 p m The guest of the evening will be Dr Sam J Cameron of Glasgow Any graduates of the University resident in Yorkshire who desire to attend should apply to the honorary secretary, Dr Wm McAdam 40 Park Square, Leeds

THE National Institute of Industrial Psychology will hold a meeting on Thursday, December 11th at 6 p m at the London School of Economics Houghton Street Aldwych, W C , when addresses will be given by Dr W J Pinard on tests of character and by Mr C B Fox on Industrial psychology applied to the blind The chair will be taken by Sir Richard Paget Bt

PARTICULARS of the lectures and demonstrations arranged for next week by the Fellowship of Medicine will be found in our Diary of Post-graduate Courses published in the *Supplement* at page 244 Copies of syllabuses and tickets of admission can be obtained from the Fellowship 1 Wimpole Street, W 1 The list of special courses arranged for 1931 is now available

THE text of Lord Moynihan's Listerian Oration delivered at Winnipeg on August 29th, under the auspices of the Lister Memorial Club of the Canadian Medical Association has now been reprinted together with Dr John Stewart's introductory speech from the *Canadian Medical Association Journal* The pamphlet has as frontispiece a portrait group taken at Winnipeg, of Lord Lister's three house-surgeons—Dr John Stewart of Halifax, Nova Scotia Sir StClair Thomson, and Mr L Vernon Cargill The proposal to found this oration was first put forward by Dr Stewart at the meeting of the Canadian Medical Association held at Winnipeg eight years ago The first of the series was delivered at the Ottawa meeting in 1914 by Dr Stewart himself, and the second in 1927 by Sir Charles Sherrington at Toronto

SIR WILFRED GRENFELL, K.C.M.G M.D delivered an address on Labrador on November 21st before the Royal Scottish Geographical Society, and received the society's Livingstone medal

THE honorary degree of M D has been conferred on Professor G H F Nuttall F.R.S., of Cambridge, by the University of Liege

DR HUGH S STANNUS has been elected Master of the Worshipful Company of Founders

PROFESSOR PORTMANN of Bordeaux has been elected president of the next International Congress of Laryngology, which will be held at Bordeaux in July, 1931.

THE third edition of the well-known handbook entitled *Stations Thermales de France* has been published by the French Thermal Climatic Federation and may be obtained from the Federation of the Health Resorts of France, Tavistock House North Tavistock Square, W C 1 A fully illustrated practical and interesting account of the various French health resorts and spas is provided in this useful booklet The spas are arranged in alphabetical order and indications are given as regards the maladies treated at each

THE National Institute of Industrial Psychology celebrates its tenth birthday next year, and in every direction its activities have been growing apace Consequently Dr C S Myers who has been director since its inception has asked to be released from the duties of directorship and has been appointed principal in order that he may devote the whole of his time to the Institute's research and educational activities Dr G H Miles has been appointed director

THE October issue of the *Journal of the Canadian Medical Association* contains a report from its Osler Memorial Committee The Simcoe County Medical Association is erecting a memorial window in Trinity Church, Bond Head Sir William Osler's birthplace A triennial Osler Oration is to be delivered Osler clubs established and Osler scholarships founded throughout Canada two scholarships have already been endowed in Osler's old school, Montreal It is suggested that medical societies should hold an 'Osler Day' every February, this month being chosen to commemorate Osler's first contribution to scientific literature, 'Xmas and the microscope, in Hardwicke's *Science Gossip* for 1868

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to **The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W C.1**

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House Tavistock Square, W C 1, on receipt of proofs

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal*, should be addressed to the Financial Secretary and Business Manager

The **TELEPHONE NUMBERS** of the British Medical Association and the *British Medical Journal* are *MUSEUM 9861, 9862, 9863,* and *9864* (internal exchange, four lines)

The **TELEGRAPHIC ADDRESSES** are

EDITOR OF THE *BRITISH MEDICAL JOURNAL, Aitiology Westcent London*

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements etc), *Articulate Westcent London*

MEDICAL SECRETARY *Mediscera Westcent, London*

The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin (telegrams *Bacillus, Dublin*, telephone 62550 Dublin), and of the Scottish Office 7, Drumsheugh Gardens, Edinburgh (telegrams *Associate, Edinburgh*, telephone 24361 Edinburgh)

QUERIES AND ANSWERS

Natural Labour after Caesarean Section

DR SMETON JOHNSON (Kidderminster), replying to the inquiry of W M ' (November 22nd, p 891), writes I have a patient who four years ago was delivered of a healthy living child by Caesarean section, the operation being performed on account of eclampsia Two years later I delivered her of a healthy child, forceps being applied, there was some troublesome post-partum haemorrhage This month she gave birth to a child weighing 9 lb, the labour being perfectly normal and lasting three hours only

DR J L BLONSTEIN (London, S W 11) writes I attended a woman for her second baby in an uneventful labour Her first was delivered by Caesarean section, on account of active tuberculosis of the hip joint I reported this case in the *Medical World* in 1926

DR H R SPARROW (Hull) writes While I was resident medical officer at Leeds Maternity Hospital a woman was delivered naturally (and she had had, if I remember correctly, five previous normal confinements), her first child having been delivered by Caesarean section She explained to me that Caesarean section had been performed owing to obstructed labour, due to a pelvic tumour, which was subsequently removed She had two operation scars in her abdominal wall The nature of the ' tumour I did not ascertain

Magnesium Hyposulphite in Asthma

DR M J FENTON (Stockwell S W 9) writes in reply to ' I T S " (November 22nd, p 891) I have been using magnesium hypo sulphite in cases of asthma for some time past So far, I have found no contraindications to the use of this remedy, having used it in cases of two to twenty five years' standing The treatment consists of intramuscular injection of 10 per cent solution of magnesium hyposulphite, at four day intervals, together with oral doses of elixir magnesium hyposulphite (A and H), two teaspoonfuls (= 15 grams) t d s I am satisfied with the results, and hope to publish them at length later on

Income Tax

Outstanding Debts General Expenses

' R M suggests that it would be fairer to pay tax on fees only when they are received, and asks what is the usual proportion of general expenses—that is, rent, maid's wages, etc —allowed to a medical practitioner

*** It would certainly be more satisfactory in some ways to exclude unpaid fees from the gross income, though it would have the rather awkward corollary that tax would have to be paid after cessation of work on fees subsequently recovered But in any case the legal position is clear — that is, that all bookings should be brought into the computation, less an estimated allowance for probable losses by bad debts The cash basis is, in fact, accepted by the Revenue Department in many cases where the gross income of the practice is steady, so that the cash receipts normally are equivalent to the net value of the year's bookings With regard to the proportion of the general expenses probably one half is as common as any fraction, but so much depends on individual cases that it is impossible to lay down any reliable generalization A useful check on any pro portion is to look at the converse side—that is, to see what is left to cover the private accommodation, service, etc , of the practitioner and his family

Supply of Implements, etc

" V E (Loud) " refers to an answer on page 806 of the *Journal* in which it is stated that sums expended for " the supply of any implements, utensils employed for the purpose of the profession ' are allowable

*** The phrase is quoted from Rule 3 (*d*), applicable to Cases I and II, Schedule D, but should be read—to make clear the meaning to be attached to the word supply "—with Rule 3 (*f*), which prohibits the deduction of " any sum employed— as capital in any profession " If the article supplied is an addition to, rather than a replacement of, the professional equip ment, then there is an introduction of additional capital involved, and the cost is not allowable This extends to the element of improvement, even when there is replacement as where a railway company was not allowed to deduct the *extra* cost involved in replacing rails and chairs by heavier ones—Highland Railway Company *v* Balderston

LETTERS, NOTES, ETC

Lymphatic Leukaemia

DR E P POULTON (Guy's Hospital, S E) writes I should be grateful if any of your readers could put me in touch with a case of lymphatic leukaemia for a special investigation A case that had been under observation for a long time, and yet showed symptoms, would be of particular value

Treatment of Alopecia with Ultra violet Rays

DR ALBERT LIDINOW (London, W) writes During the past five years I have treated six cases of alopecia totalis by means of ultra violet rays, four of these were men and two were women The male patients were between the ages of 32 and 54 years, and had had complete alopecia for over six years before they started treatment with me They have responded very well to treat ment, and have now recovered growth of hair The female patients were both over 50 years of age, and much more refrac tory to treatment I have found that general irradiation of the skin of the body following the technique of short ultra violet ray therapy is of greater importance than just the local treat ment to the scalp and the other hair growing areas Many have suggested that a full erythema or blistering dose of light causing counter irritation gives good results On the whole, I have found that this is damaging, for during the stage when the hair just appears the blistering reaction will be followed by desquama tion, and the young hairs are removed with it The minimal erythema dose is preferable The treatment of complete alopecias is slow and laborious, needing much perseverance both on the part of the patient and of the physician The patients were treated twice a week, the first signs of hair were only seen after two months' treatment, and good growth of hair was observed after nine months' treatment It is difficult to regard this treatment as purely a local counter irritation effect The results suggest that there may be some activation of a hormone which stimulates the growth of hair, for in these cases the pubic hair recovered, and this area never received irradiation The results in isolated patches of alopecia areata are well known and need no further description I have seen some favourable results in cases of early baldness with thinning and loss of hair This has been arrested by irradiation of the scalp combined with general irradiation of the body I feel that the latter is of much importance in the treatment of alopecia

A Paste Bandage for Varicose Ulceration and Phlebitis

WE are informed by Mr C J CELTIAN-JONES, F R C S, and DR KATHERINE CELTIAN JONES that since the appearance of their description of a new paste bandage for the treatment of varicose ulceration and phlebitis in the *Journal* of October 4th (p 560), they have received many inquiries for samples of these dressings, but have been unable to comply with the bulk of the requests, because the preparation of these bandages entails outlay in material and impregnating media They have now arranged with Messrs Cuxson, Gerrard, and Co , Ltd , surgical dressing makers of Oldbury, Birmingham, to prepare a paste bandage strictly according to the published formula, and to pack it in the manner described in the article They add that, apart from dispatching specimen bandages, they will gladly continue to answer letters dealing with the technique of the treatment

Renewal of Driving Licences

THE Automobile Association advises motorists that the practice of certain licensing authorities of issuing reminders about renewal of their driving licences is likely to be discontinued The A A has for many years kept a *Register of Driving Licences*, by means of which any member who furnishes the necessary particulars of his licence receives a postcard reminder seven days before date of renewal Particulars of date of renewal and the address to which the reminder should be sent should be forwarded to the secretary, A A , Fanum House, New Coventry Street, W 1

Vacancies

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals will be found at pages 48, 49, 50, 51, 54, 55, and 56 of our advertisement columns, and advertisements as to partnerships, assistantships and locumtenencies at pages 52 53, and 54

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 243

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

477 Psittacosis in Denmark

C H WÜRTZEN (*Ugeskrift for Laeger*, September 25th, 1930, p 907) gives an account of how psittacosis came to Denmark, and of the investigations made into its etiology On February 1st 1930, the steamship *Louisiana* came into the port of Copenhagen with a crew of 34 men not including the officers She had left Bahia on January 6th In this port the crew had bought thirty Brazilian parrots Some of them looked poorly at the time of purchase and several died during the voyage Most of the survivors were sold in Madeira, and of the five parrots which reached Copenhagen alive two were ill Nine days after the ship left Bahia one of the crew became ill, and was admitted to hospital in Madeira, where he subsequently recovered Several new cases occurred during the last eight days of the voyage, and six of the crew were admitted to the fever wing of the Oresunds Hospital At the State Serum Institute repeated examinations were made of the blood urine and faeces of all these patients They were examined for the bacilli of typhoid fever, paratyphoid A and B, Bang Breslau, Nocard, Gaertner, suipestifer, paradysentery Flexner D, Flexner H, Sonne and Shiga The results were almost completely negative little importance was attached to the rare positive findings After giving detailed accounts of the clinical course of these cases none of which terminated fatally, Würtzen points out that the uniformity of the symptoms indicated a common causative agent The most prominent feature was pneumonia, which, as has already been pointed out in connexion with psittacosis was characterized by absence of cough expectoration, and pain in the chest, and the occurrence of only slight dyspnœa though there was comparatively severe cyanosis Considering what frequent facilities there must have been for exposure to infection during the voyage, it is noteworthy that out of a crew numbering altogether about 40 only 9 should have contracted the disease including 2 in whom it broke out after the ship had left Denmark.

478 Prognosis of Epidemic Encephalitis in Children

H A. HOWE (*Bull Johns Hopkins Hosp*, September 1930 p 123) records his observations on sixty six children in the Harriet Lane Home for Invalid Children at the Johns Hopkins Hospital who were investigated at periods ranging from one to ten years after the onset of epidemic encephalitis The immediate mortality was 11 per cent complete incapacity was found in 19 per cent partial incapacity in 22 per cent and recovery in 42 per cent The acute illnesses fell into the following three groups (1) somatic (56 per cent), characterized by paralyses or irritation of the somatic or cranial nerves (2) meningeal (16 per cent) in which signs of meningeal irritation predominated and (3) abortive (19 per cent) without any acute illness of the ordinary encephalitic type but with early and frequently unheralded appearance of the characteristic progressive sequels often accompanied by febrile reaction The immediate mortality was highest in the somatic group recovery was almost invariable in the meningitic form and Parkinsonism was most frequent after the abortive form The sequels were divided into progressive and non progressive, the former including hyperactivity, sleep inversion, changes of personality hyperpnœa, and tics while the latter type of sequels was characterized by paralysis choreiform movements, emotional instability, and mental retardation The non progressive sequels most frequently followed the somatic type and with the exception of mental retardation had a good prognosis. The outlook of progressive sequels was unfavourable

479 Train and Motor Travel Sickness.

ACCORDING to J E LEBENSOHN (*Arch of Ophthalmol*, September 1930 p 342) sickness caused by train or motor car travelling is less prevalent than that experienced in a ship or aeroplane children are less subject to sea sickness but more to car sickness than adults There appears to be a familial tendency to this condition The author advises that susceptible persons should preferably ride in the front seats since movement is less there The disorder may be attributable to ocular or labyrinthine stimuli In order to decide which was the true cause patients were required to look at vertical stripes on the inside of a revolving drum while a tracing of the gastric movements was at the same time obtained by means of a swallowed air bladder connected to a water manometer The author found that revolving the drum to and fro instead of in one direction produced rather greater gastric movements Temporary upset of the ocular muscle balance with prisms did not appreciably alter the character of the tracing When the ear was douched with cold or hot water it produced an immediate and definite change in the gastric tone, as also did douching of the auricle and face with cold water From these experiments it is concluded that car sickness was due to labyrinthine stimulation rather than to nystagmus This latter condition is dependent upon fixed attention, and ceases when the attention is withdrawn, which affords another argument in favour of this conclusion Lebensohn nevertheless advises the correction of any error of refraction and muscle balance, since he has already shown that such defects are gastric depressants they must therefore, leave the digestive tract especially susceptible to further depressing influences

480 Meningococcal Meningitis

K C SMITHBURN, G F KEMPF, L G ZERFAS, and L H GILMS (*Journ Amer Med Assoc*, September 13th 1930 p 776) record their observations on 144 cases of epidemic meningococcal meningitis treated at the Indianapolis City Hospital between November 11th, 1929 and April 1st 1930 Of these 56 9 per cent were of the fulminating or hyperacute type, and 68 7 per cent showed cutaneous haemorrhages in the form of petechiae or purpuric blotches In the fulminating type intrathecal administration of serum proved to be inadequate, although rapid improvement took place in the condition of the spinal fluid the intramuscular and intravenous routes were also used for the injection of serum. Intravenous administration of an antiseptic solution was ineffective in spite of its activity *in vitro* Of 119 patients from whom blood cultures were made 76 (63.8 per cent) showed meningococci There was an approximate parallelism between the incidence of petechiae the percentage of positive blood cultures and the mortality rate throughout the epidemic.

Surgery.

481 Congenital Absence of Abdominal Muscles.

J HOFSTEIN (*Gynécol et Obstét* July 1930 p 23) has found only twenty two cases of this condition recorded previously and Schlesinger and Overweg in Vienna discovered only one case among 11 000 children Before 1909 185 cases of absence of the pectoral muscles had been reported while there were only eleven of absence of the abdominal muscles The condition is associated frequently with other congenital deformities, such as atrophy or absence of the bones or of the urogenital organs In Hofstein's patient a female infant and the youngest of six children absence of the muscles of the abdominal wall was the only abnormality, the great majority of children in whom this condition was found have been males The parents and all the other children were healthy and quite normal and the mother's Wassermann reaction was negative When the infant was lying on her back the abdominal wall was flaccid and voluminous In both flanks were seen ridges and prominences On raising the infant the abdomen became pendulous The skin was very thin with a definite transverse striation in the sitting position When the child was lying on her back the skin fell into longitudinal folds there was no sign of muscular contraction except (very feebly) on the right side when the child cried Occasional peristalsis was visible All the abdominal organs could be palpated beneath the skin, and after feeding the stomach outline was prominent The umbilicus was normal The bowels and bladder were emptied frequently without abdominal effort and the bladder appeared to be hypertrophied Respiration was entirely thoracic The child moved her limbs and sucked normally she gained weight. No muscular contraction occurred after electrical stimulation of the abdominal surface Skiagrams showed a normal skeletal development but the diaphragm was quite flat and immobile There was no diaphragmatic hernia nor evidence of progressive muscular atrophy nor of anterior poliomyelitis Electrical treatment has been recommended but Hofstein applied a firm bandage this was replaced subsequently by a belt a form of treatment which has been stated to have effected a cure at puberty in one case The child died suddenly when a few months old, and no necropsy was allowed

482. Spondylitis Infectiosa

H PUHL (*Deut Zeit f Chir*, September, 1930, p 172) describes the clinical, pathological, and radiological characteristics of infective spondylitis, and records six cases in detail The disease is most commonly a sequel of typhoid fever, but may follow paratyphoid, typhus, scarlatinal, measles, influenzal, pneumococcal, and pyogenic infections For a week or two after the primary disease the patient is usually free from symptoms, after which vague pains in the back, and later in the distribution of the spinal nerve roots, appear and rapidly increase in severity Most commonly one of the lower thoracic vertebrae is affected, and becomes sensitive to pressure and percussion There may be local oedema, lack of movement of the spine, which is rigid well above and below the affected vertebra, is pronounced The normal lumbar lordosis may be lost, or be replaced by a slight kyphotic curve The patient climbs up his legs with his hands when assuming the erect posture There may be slight disturbance of reflexes, with atony of the bladder and rectum, but paralysis is rare The degree of general disturbance varies, usually there is moderate pyrexia and leucocytosis, with marked acceleration of the sedimentation rate of the blood The duration of the disease is variable, and a fatal result is very rare The pathology is somewhat obscure, especially the factors which cause what is undoubtedly an osteomyelitis to run such a relatively benign course, usually without gross pus formation Radiological observation of the author's cases indicates four stages At first, as in osteomyelitis, no changes are to be seen In a week or two a diminution in size of the intervertebral disc occurs, usually at one side, so that the disc becomes triangular and the neighbouring vertebrae are tilted Bony changes may be seen at this stage or later, starting in the "end plates" of the vertebral body, near the upper or lower borders Cavities form in the bone, they coalesce, and cause a roughened appearance of the margins Occasionally changes also occur in the transverse processes or vertebral spines In the next stage reparative processes are visible, starting in the region of the periosteum, but the vertebral body now has a "washed out" and indistinct appearance, contrasting sharply with the intense shadow of the new bone Finally, the regenerated bone is partly absorbed, but may extend to fuse with the neighbouring vertebrae The shape of the vertebral body is largely retained throughout, only a slight diminution in size taking place Most characteristic of the disease is its site of origin in the intervertebral disc and neighbouring margins of the bone, although the former changes are first observed, Puhl thinks that the primary focus is in the bone. Diagnosis is usually easy, though the disease bears a strong resemblance to the fibrous form of "benign tuberculous spondylitis" In the final stages the changes are those of spondylitis deformans, but localized to the region of one vertebra Treatment is mostly conservative, and rest in bed in extension or plaster relieves the pain In cases of clear etiology specific treatment may be tried Active surgery is limited to the draining of abscesses, though these do not commonly occur In cases of doubt exploratory puncture should be undertaken Treatment is controlled throughout by x ray examinations, and during the stage of recovery some form of spinal corset may be necessary to relieve pain and prevent deformity

483 Misleading Symptoms in Carcinoma

W BERGER (*Med Klinik*, October 3rd, 1930, p 1476) describes certain symptom complexes seen in cancer cases which suggest another condition, and may even lead to a wrong diagnosis These occur in cases without apparent localizing symptoms of either a primary tumour or metastases, and with nothing suggestive in the history or general condition Three groups of cases are defined The first, or pseudo cardiac, is that of the elderly patient in whom the digestive disturbances of a gastric carcinoma may be attributed to congestion due to a failing heart In apparent cardiac insufficiency with oedema the following features are said to be suggestive of carcinoma absence of history of heart trouble and of definite signs on examination, such as dilatation, arrhythmia, and murmurs, oedema with a normal sized heart absence of cyanosis, and the peculiar skin which characterizes a cancer cachexia In the second group, pseudo septic and febrile types, there is associated with chronic pyrexia some degree of anaemia and no recognizable localizing symptoms, the cachexia, lowered haemoglobin percentage, and the leucocytosis are all common to sepsis and neoplasm In any unexplained fever of long duration carcinoma should be considered, since fever may occur not only in an ulcerated tumour, or with mixed infection, but in an intact one, and most commonly where there are bone metastases, hypernephroma, or bronchial carcinoma The third group, the pseudo rheumatic and pseudo neuralgic forms, exhibit pains in the joints, bones, nerves, and muscles. Metastases in bone are often the cause of the symptoms, if they cannot be explained, and the patient is elderly, a search should be made for the primary tumour or for tenderness in bone An x ray photograph should be taken to reveal metastases in bone, but a negative result is not necessarily conclusive Berger remarks that such cases are not much noticed in the literature or practice They are important, nevertheless, since in the pseudo septic type a diagnosis of carcinoma may be made in time for cure, or at any rate for a correct prognosis and the avoidance of treatment which can do no real good

Therapeutics.

484 Vaccine Therapy in Catarrhal Conditions

H G MURRAY (*New England Journ of Med*, October 9th, 1930, p 727) has investigated the value of vaccine therapy in the common cold occurring in industrial workers in a large manufacturing industry, a stock catarrhal vaccine being injected subcutaneously in carefully graduated doses at intervals of forty eight to seventy two hours Those selected for treatment were persons who had several head colds each year and lost time from work Following inoculation, the majority of the patients had no more than a slight tenderness at the site of injection Only about 1 per cent had a rather severe reaction, which lasted from eighteen to twenty four hours In 1927 83 persons were thus inoculated, the average age of the group being 43 years In 1928 169 persons accepted the treatment, and 61 persons were treated in three successive years Murray's conclusions are that catarrhal vaccine as a preventive for head colds is uncertain in its results In the group which had vaccine treatment for three successive years the total number of colds was reduced from 245 to 95, and the previous yearly average of four colds fell to one and a half The author considers that vaccine treatment seems to be helpful in about 50 per cent of cases, and that such a reduction renders the treatment in industry economically sound

485 Dietetic Treatment in Gall bladder Diseases.

WITH the increase, due to newer diagnostic tests, in the number of gall bladder cases, the diet in these conditions has gained importance M EINHORN (*Med Journ and Record*, September 3rd, 1930, p 227) mentions the diets advocated by various authorities, and remarks that there is no diet known which will prevent the formation of gall stones, or dissolve them after their development The only means of influencing gall bladder affections beneficially is to create a greater flow of bile, this can be achieved by a variety of mineral salts and waters, various cholagogue remedies, and foods In arranging a diet for these diseases they must be divided into acute and chronic affections, without or with jaundice Acute affections of the gall bladder, usually cholecystitis, run a comparatively short course A light liquid diet of milk, gruels, and fruit juices may be given every two or three hours When the patient feels better, cereals, toasted bread, fruit, and cooked vegetables may be added, and later on tender meat While the amount of food taken is not essential, the quantity of fluids should be at least three quarts a day In chronic affections a sufficient quantity of nourishment must be given The following rules apply to all gall bladder cases Meals should be taken frequently, and at not too long intervals, in order to induce complete emptying of the gall bladder quite often Each meal should contain proteins, carbohydrates, and fats in the right proportions Excessive quantities as well as too luxurious meals should be carefully avoided Excess of spice, meat, beer, or wine is to be guarded against Increase of fluid intake should be encouraged The bowels must be thoroughly evacuated daily Outdoor sports and long walks may be undertaken as long as there is no severe fatigue In cases without jaundice, all kinds of foods, except highly indigestible or strongly spiced ones, are permissible In jaundice cases an appropriate diet must be carefully selected Fats here are poorly utilized, and should therefore be given with great moderation, a daily allowance of skimmed milk, wheaten bread, oatmeal flour, and sugar is suggested To this can be added fresh fruit and green vegetables, and later one or two eggs To increase the digestibility of the food, pancreatic ferments may advantageously be given Patients with malignant disease of the gall bladder and biliary ducts must be similarly dieted At first a diet as previously outlined may be employed When the disease is advanced and the patient cannot assimilate the usual foods, liquids and semi solids must be selected An attempt must be made to keep the body from losing too much, but towards the end adequate nutrition is seldom possible All food must be selected so as to give comfort and pleasure to the patient.

486. Treatment of Iritis in Mumps

J M ORTEGA (*Arch de med cir y esp* October 18th, 1930, p 358), who records two illustrative cases in soldiers states that since Combeau in 1867 first drew attention to the ocular complications of mumps not more than half a dozen cases of iritis due to this cause have been described Ortega's first case occurred in a man, aged 22 who developed bilateral iritis ten days after the onset of mumps All other causes such as syphilis gonorrhoea and trauma, could be excluded, and the Wassermann reaction was negative Complete recovery ensued after eighteen days treatment by mydriatics The second patient developed bilateral iritis while the parotid swelling was still present Treatment in this case consisted of injections of lactoprotein associated with the application of mydriatics Some impairment of vision in the right eye persisted, however, owing to the formation of synechiae

Radiology

487 Radiology of the Base of the Skull.

G E PFAHLER (*Radiology*, September, 1930, p 339) ranks study of the base of the skull as one of the most important steps in the investigation o intracranial disease and disease of the nasal accessory sinus Early workers in *x* ray diagnosis of accessory sinus disease referred especially to the opacities in the cavities caused by exudate, but later authorities depend rather on the changes in the bony structures Granger called attention especially to the alterations in the bones forming the roof of the sphenoid sinuses, and Law emphasized the importance of the variations in appearance of the walls of the ethmoid cells For the study of these changes perfect radiographs which show the minute details are necessary A fine focus tube, the smallest possible diaphragm that will include the sinuses, and absolute stillness of the patient and the tube are important factors The sagittal plane must be exactly perpendicular to the plane of the film As a routine procedure Pfahler secures three stereoscopic films anteriorly one lateral film, and one of the base of the skull A special head rest and localizer are used The patient is placed in the prone position with the arms folded in front of the head rest under the chest and with the sagittal plane over the longitudinal line the lower border of the orbit is brought over the transverse line When desirable the posterior part of the base of the skull can be further studied by arranging for the patient to lie prone and to bend the head forward so as to bring the base of the skull parallel with the plane of the film the shadow of the cervical spine which is always demonstrable in the occipital region in the first position is thus avoided Further details of the technique are given The normal radiological findings and those of acute superficial sinusitis and of deep perisinusitis are described The alterations noted so often may be divided into two classes those which affect the sella turcica and those which affect the adjacent structures Pfahler has found these studies of value in determining the cause of obscure neuralgias headaches and ocular disturbances Other pathological conditions demonstrable by this study of the base of the skull are brain tumours fractures of the base anomalous conditions and congenital defects variations in the floor of the sphenoid sinuses and extension of malignant disease from the nose, throat, or accessory sinuses

488. Radium in Intra-oral Cancer

D QUICK (*New York State Journ Med*, September 15th 1930, p 1034) quotes from a report prepared for the Stockholm Congress of Radiology the results of treatment between 1917 and 1927 of 473 patients suffering from cancer of the tongue which he considers as fairly typical of intra oral cancer in general On June 1st, 1928 105 (22.4 per cent.) were free from clinical signs of disease and 23 of them had remained free for five years It is emphasized that methods are changing from day to day, and it must be remembered that failures in the past may sometimes have been due not only to utilizing a technique now out of date, but also to the personal factor of imperfect use of the best technique available at the time. He considers irradiation is the best method for treatment of the primary growth in intra oral cancer the accuracy of the dosage and its placing are of extreme importance Martin and Quimby have measured by physical and mathematical means the exact dosage of radiation delivered to the tumour bearing area in successfully treated cases It has hence been possible to measure in units of skin erythema doses" the amount required for different types of growth Most epidermoid carcinomata require six to ten erythema doses, delivered over a period of two or three weeks embryonal transitional cell" carcinomata or lymphoendotheliomata of the nasopharynx, require least treatment so far as epidermoid carcinomata are concerned, while squamous-celled carcinomata rarely yield to less than ten full erythema doses Radium must not be depended on alone, to the exclusion of associated means of treatment, and high voltage *x* radiation is an essential adjunct in intra-oral cases, unless very large quantities of radium are available for use by surface application Operative surgery is often necessary for access drainage, and dealing with diseased bone The author remarks that there is no place in radiotherapy for the technician" without surgical experience or for the loaning" of radium to un skilled practitioners Operative surgery is indicated in addition to radiotherapy where there is definite early glandular involvement by adult type epidermoid carcinoma Surgical exposure is required for radon implantation in metastatic deposits in the neck when they are of the embryonal epidermoid type and in all cases where the gland capsule has been perforated by growth, in preference to any attempt at block-dissection

489 Intravenous Pyelography

M. JUNGANO (*Rinascenza Medica*, September 1st 1930 p 411) compares the advantages of intravenous pyelography by means of uroselectan with the ordinary ascending method Uroselectan is a derivative of pyridine containing 42 per cent of organically combined iodine it is water soluble and is eliminated by the kidneys in sufficient concentration to throw a shadow The technique is as follows The patient is given castor oil for two days and kept on a farinaceous diet, since gas in the intestines obscures the picture no food is given after the evening of the second day On the third day 40 grams of uroselectan are slowly dissolved in 100 c cm of twice distilled water The solution is filtered twice, autoclaved for twenty minutes and injected into a warm into an arm vein preferably in one dose with a short barrelled 100 c cm syringe The elimination of uroselectan is very rapid the first picture should therefore be taken immediately after the injection and others after fifteen forty five and seventy five minutes In diseased conditions a clear picture may not be obtained for six to twenty four hours The examination is thus a costly process The author does not believe that the method is sufficiently trustworthy to indicate operability but thinks its use is restricted to localization in cases where ascending pyelography is impossible such as occlusion of the urethra and ureters acute and chronic cystitis tumours, and fistulas as well as in advanced pregnancy debilitated patients and small children There appear to be no contraindications even thyroid cases are not affected since the iodine in uroselectan is not broken down and apart from occasional dryness in the throat headache and slight transient febrile reaction no inconvenience is felt by the patient The author reports his findings in twenty nine cases in some the pictures obtained were sufficiently clear to enable an exact diagnosis to be made, but in most instances this was not possible, the *x*-ray photographs being often incomplete He recommends that apart from the special indications intravenous pyelography should be used as an auxiliary or control to the ascending method.

Obstetrics and Gynaecology.

490 Leukaemia and Pregnancy

H O NEUMANN (*Zentralbl f Gynak*, September 27th 1930 p 2443) states that since his collection two years ago of twenty eight cases of leukaemia and pregnancy three new cases have been recorded to which he now adds another of his own In Kaplan's case abortion was induced at the fifth month in a woman, aged 26 receiving *x* ray treatment for myeloid leukaemia In Geller's case chronic myeloid leukaemia hitherto apparently symptomless was diagnosed after death in a woman who succumbed to uterine haemorrhage two hours after cervical Caesarean section In Allen's case acute lymphatic leukaemia developing in the third month of pregnancy in a primipara, aged 20 proved fatal six days after abortion had been induced In none of these cases was leukaemia present in the foetus Neumann's patient suffering from chronic myeloid leukaemia for which the spleen and long bones had been subject to *x* radiation became worse during pregnancy which terminated about the third month in spontaneous abortion with serious haemorrhage she subsequently improved It is concluded that although pregnancy may continue without incident, and labour be normal during the first two years of a chronic myeloid leukaemia this malady constitutes (independently of its severity) an indication for the artificial termination of pregnancy and for sterilization The latter may be effected by *x* radiation of the ovaries conveniently performed at the same time as that of the spleen, or by insertion of radium in the uterus, as

in the present author's recent case In acute lymphatic leukaemia the prognosis is hopeless, so that interference with the pregnancy is of no avail, and is only indicated when there is a chance of foetal survival In chronic lymphatic leukaemia, as microscopic examination of the endometrium shows, conception is impossible

491 Pregnancy and Asthma or Hay Fever

A C WILLIAMSON (*Amer Journ of Obstet and Gynecol*, August, 1930, p 192) records case histories of one or more pregnancies in twenty eight patients who suffered from asthma or hay fever It was noted that many of the asthmatic patients had less frequent attacks during gestation and the puerperium, but that the pollen sensitive subjects showed little variation Premature labours and miscarriages did not occur Several of the asthmatic mothers were comfortable when carrying a male child, but had severe urticaria or food sensitiveness during gestation of a female, or vice versa Two of the asthmatic patients died during the puerperium As anaesthetics in labour both nitrous oxide oxygen and ether were well tolerated As proving the existence of an hereditary tendency it is noted that in the asthmatic group almost all, and in the hay fever group the majority of, the infants showed food sensitiveness, eczema, *and/or development later in childhood of bronchial asthma*

492 Rigidity of the Cervix

JANET M GRAY (*Journ of the Christian Med Assoc of India*, September, 1930) describes cases of rigidity of the cervix as seen in India In two instances after several days' labour an oedematous cervix, with edges 1½ inches thick, and only slightly dilated, protruded beyond the vulva, it was amputated, but neither mother nor child survived forceps delivery In two other cases the cervix, which was moderately dilated, was hanging six inches outside the vulva, but a living child was delivered by forceps, in one of these cases lateral tears were produced during extraction and were afterwards stitched, while in the other instance lateral cervical incisions, three inches in length, were made as a preliminary A case is recorded of persistent cervical rigidity, with delivery of the child through a hole in the posterior wall of the cervix (cervico vaginal fistula) In two cases of rigidity the condition was not relieved by an enema, hot douches, and the administration of chloral hydrate, opium, and potassium bromide The vagina was packed tightly under chloroform anaesthesia, and half a grain of morphine was given hypodermically The patient slept for some hours and expelled the packing, by which time dilatation sufficient to allow forceps extraction of a living child had been secured

493 Rupture of the Membranes during Pregnancy

RHENTER (*Bull Soc d'Obstét et de Gynécol de Paris*, July, 1930, p 500) alludes to a recent communication by Schwaab and Walther recording birth of the living infant 73 days after rupture of the membranes during the fifth month of pregnancy He also mentions records by other writers of labour taking place 52, 62, 63, and 110 days respectively after rupture of the membranes He records a case observed under favourable conditions in the wife of a medical man, in which amniotic fluid was voided intermittently, in large amounts, under considerable pressure, during 130 days from the fifth month of pregnancy Abdominal examination showed excess of amniotic fluid, varying after the successive liquid discharges, without great increase of tension It is concluded that the rupture was situated high up in the uterus A living healthy infant weighing 8 lb 12 oz was delivered at term

Pathology.

494 Association of Diphtheria Bacilli with Chronic Affections of the Nose

R SCHROEDER (*Ugeskrift for Laeger*, October 2nd, 1930, p 927), of the State Serum Institute and of the Ear Department of the Communal Hospital in Copenhagen, has investigated the nasal flora of 262 persons, of whom 209 were 15 years or older, the remainder being under the age of 15 In the first group, consisting of 126 persons, some nasal affection was present In the second group, consisting of 71 persons, affections of the throat existed The third group included 45 patients suffering from diseases of the ear He does not classify the remaining 20 persons Of the 40 persons found to harbour the bacillus of diphtheria (15 65 per cent), as many as 38 belonged to the first group Only 4 harbouring diphtheria bacilli in the nose also had them in the throat In none of the positive 38 nasal cases was there any record of a previous attack of diphtheria The nasal conditions for which these patients had sought medical aid, and had in the process been found to be carriers of diphtheria bacilli, were for the most part of a chronic character All the 16 patients suffering from chronic, atrophic, fetid rhinitis harboured diphtheria bacilli, and this was the case with 16 of the 23 patients suffering from simple atrophic rhinitis, with 2 of the 10 cases of mucous polypi, with 2 of the 18 suffering from diseases of the nasal sinuses, and with 1 of the 9 who had chronic hypertrophic rhinitis The diphtheria negative did not distinguish themselves from the diphtheria positive cases clinically, and it would therefore be unjustifiable, from the clinician's point of view, to employ the term "chronic diphtherial rhinitis" Four cases of chronic atrophic rhinitis, harbouring diphtheria bacilli, were treated with antitoxin, and in 2 of these cases there was temporary clinical improvement, in the other 2 this treatment had no effect In one of the 4 cases the diphtheria bacilli could not be demonstrated subsequently Ten of 39 cultures of diphtheria bacilli obtained from these carriers proved to be virulent for guinea pigs Schroeder concludes that, considering how many persons there are who constantly harbour diphtheria bacilli in the upper respiratory passages, it is not feasible to isolate such carriers The remedy he advocates for this state of affairs is active immunization with diphtheria anatoxin of the neighbours

495 Testing the Virulence of the Diphtheria Bacillus

R SCHROEDER (*C R Soc de Biologie*, October 16th, 1930, p 91) has compared the intracutaneous and subcutaneous methods of testing the virulence of the diphtheria bacillus The intracutaneous method was carried out by injecting 0 2 c cm of a suspension, standardized to 500 million organisms per cubic centimetre, made by washing off a 24 hour ascitic agar culture with saline A positive reaction was characterized by the development of a red infiltration in twenty four to forty eight hours, followed by necrosis one or two days later The subcutaneous test was performed by injecting 1 5 c cm of a 24 to 48 hour broth culture into guinea pigs weighing 300 grams Altogether 229 strains of diphtheria bacilli were examined, of these, 115 proved virulent by the intracutaneous and 159 by the subcutaneous method Two strains proved virulent by the intracutaneous and not by the subcutaneous route The discrepancy between the two methods resembles that obtained by Moshage and Kolmer, who likewise found that the subcutaneous method gave a higher proportion of positive results

496 The Value of Peroral Immunization

R PFEIFFER and H LUBINSKI (*Zentralbl f Bakt*, September 30th, 1930, p 152) have carried out a number of experiments on rabbits to ascertain whether it is possible to produce an active immunity by the oral administration of heat killed bacteria As antigen a thick suspension of El Tor vibrios was used, standardized so that 1 c cm of saline suspension contained 100 mg of bacteria Three doses were given at weekly intervals, and the animals were bled ten days after the last dose In some rabbits the organisms were introduced directly into the stomach by a catheter, in others they were contained in rolls, which were fed to the rabbits in the usual way In some animals sensitization with bile or with sodium benzoate was practised before each dose, in others no preliminary sensitization was attempted The results were very disappointing Not a single animal developed agglutinins as demonstrated by the usual test, a control rabbit, on the other hand, which received a single dose of only 1/25 mg intravenously, gave a titre of 1/160 Examination for bacteri cidins showed that some of the animals which had been given the organisms by a catheter had a moderately bactericidal titre, though very much lower than the animal which had received a single dose intravenously The serum of the animals which had been simply fed with the bacteria was practically devoid of bactericidal action No marked difference was noted between sensitized and non sensitized animals A second experiment was performed in which the organisms were given by a pipette instead of a catheter, so as to avoid any injury to the alimentary mucosa In these animals again no agglutinins were formed, and in contrast to the catheter fed animals of the first experiment there was practically no development of bactericidins The authors conclude that peroral immunization of *rabbits with* killed cholera vibrios calls forth only a minimal antibody response Experiments made on a small number of human volunteers using killed typhoid bacilli, administered along with bile or sodium benzoate, indicated no formation of agglutinins or bactericidins The replacement of the well tried parenteral method by the peroral method of vaccination would, in their opinion, be entirely unjustified

ERBOLIN

(Ergot in ideal form)

ERBOLIN is stabilised and standardised ergot enclosed in capsules each of which contains the equivalent of 0·5 mgm (1/120 h grain) of ergotoxine phosphate in addition to the other active constituents normally present in ergot of the finest quality

SPECIALLY MANUFACTURED BY
STAFFORD ALLEN & SONS LTD
FOR THE
GLAXO LABORATORIES
56 OSNABURGH STREET
LONDON N W 1

ADEXOLIN CAPSULES

A highly concentrated preparation of vitamins A and D for general use in infective processes

ADEXOLIN is a physiologically and chemically standardised concentrate of vitamins A and D in capsules of which each contains the vitamin A equivalent to 4 drachms of medicinal cod liver oil and 2 000 (M.R.C.) units of vitamin D

In boxes of 25 capsules - 5/
In boxes of 100 capsules - 15/-

GLAXO LABORATORIES

LONDON N W 1

An Income of £500 a year—

AND A CASH PAYMENT WHEN YOU RETIRE

THAT is what a man aged 30 next birthday may secure, at age 65, by taking out an Endowment Assurance Guaranteed Bonus Policy with the Prudential.

The Annual Premium would be £88 10s 10d., but allowing for Income Tax Rebate as 2s. in the £1, and assuming that the rate and conditions of rebate remains unchanged, the

Yearly Outlay would be £79 : 13 : 9

and in the event of death at any time before 65, £2,500 plus guaranteed Bonus Additions of £75 a year (almost as much as the yearly outlay) would be available for his dependants.

If you would like a guaranteed income of £500 a year at age 65 or earlier fill in and forward this coupon or write mentioning this Journal

To
THE PRUDENTIAL ASSURANCE CO LTD.,

ACTUAL BRITISH MAKERS

Modernity and Elastic Hosiery

In the present age, when strenuous exercise—especially dancing—is so prevalent, the danger of discarding elastic hosiery is obvious to Medical Men In order to prevent this risk we have produced our famous

"DRESS SILK" HOSIERY

which is inconspicuous when worn under the fashionable silk stockings of to-day

This is a special fabric made from finest China silk with rubber strands, and is naturally more expensive and not suitable for rough usage.

We supply, however, 10 qualities of Elastic Hosiery in eight different colours, to meet the requirements of all classes of patients

CREOLIN

(MEDICAL)

Indicated for Use in Varicose Ulcers

CASE REPORTS have shown Creolin to be of marked value as a dressing for varicose ulcers Whilst displaying adequate germicidal properties Creolin at the same time exerts a powerful stimulating action which induces regeneration of the surrounding tissues The Creolin dressing is best applied by steeping ordinary surgeon's lint in a dilution of 1 part of Creolin to 300 parts of water Creolin is a *Liquid Antisepticus* of high germicidal strength combined with low toxicity prepared from highly refined coal tar oils R W co-efficient 18-20

Testing samples and full particulars sent on application to —

DEAF DOCTORS
AND DEAF PATIENTS

have proved 'ARDENTE" a boon—a Heart Specialist whose work is so dependent on his hearing writes

Ardente' is a godsend to me without 'ARDENTE" he is to all intents and purposes, "stone" deaf, with 'ARDENTE' he carries on his work—what better testimony to "ARDENTE" merit?

Mr Dent makes a Stethoscope specially for deaf Doctor—the only one of its kind which is widely used and praised. Doctors whose work lies amongst the deaf prefer to prescribe ARDENTE because they know that ARDENTE is the only individual method in the whole deaf world (no mass production way can ever succeed with human disabilities) and they know what "ARDENTE" service stands for to the deaf. Many doctors who are deaf use ARDENTE

ARDENTE" is entirely different and uncopyable and succeeds in widely differing cases. A full range covers the needs of those suffering from various forms and degrees of deafness and tinnitus. Minutely adjusted to the requirements of the case for young, middle-aged or old and so sensitive as to have the desired effect even in middle-ear and nerve cases bringing into action and stimulating the auditory system enabling it to function naturally and saving atrophy. "ARDENTE" can be used or not at will, and is sold under guarantee.

ARDENTE" is the choice of Doctor and patient—only after test and hearing or from description or particulars is ARDENTE" fitted, toned, tried, adjusted, supplied, and serviced.

Tests and demonstrations given at Doctors', patients' or our addresses without fee or obligation.

MR H. DENT'S

Ardente

THE CURTIS ABDOMINAL SUPPORT
MODEL N°1

is the only support that gives direct abdominal uplift without cramping or binding the patient in any way

The principle is that of an anterior-posterior pressure and sufficient proof of its efficiency lies in its frequent use in the greater London Hospitals and by the medical profession who know that it is—

Woollen Underwear is Healthiest

If the case for woollen underwear had been an old wives' tale, wool would have died as unlamented as tight-lacing corsets

But people know that winter woollens are still good sense.

Apart from its warmth and comfort, scientific investigation* has shown wool to be very absorbent, and more important still, to retain better than any other material the moisture it has absorbed It therefore protects against sudden chills and the discomfort due to condensation of moisture on the skin

Where rheumatism is feared, woollen underwear allows free perspiration without the danger of constant damp

Wolsey pure wool underwear is as good a woollen underwear as there is It is both soft and hard-wearing, unshrinkable, and is made in a widely accommodating range of styles

WOLSEY

underwear

for Women, Men and Children

*Details of the investigation made by the British Research Association for Wool will gladly be sent to any medical practitioner on application to Wolsey Limited, Leicester

DOCTOR'S CHINA TEA

WHY IT IS PRESCRIBED FOR GASTRIC PATIENTS

When ordinary tea is out of the question it is essential that only really good China should be drunk The Doctor s China Tea has won the enthusiastic approval of practi tioners simply because it is a perfect blend of a good China leaf with all excess tannin eliminated It can therefore be prescribed for invalids and dyspeptics with safety—it has no ill after-effects

who have both had many years' experience as Medical Transfer Agents

The commission chargeable in respect of any practice or partnership in Great Britain placed exclusively in the hands of this Agency has been fixed on an exceptionally favourable scale, the maximum chargeable on any transfer being fifty pounds (£50)

No charge is made to Principals for the introduction of Locum Tenens or Assistants
Accountancy and legal services furnished by the Agency, where desired, at moderate inclusive charges.

1 WITHIN 100 MILES OF LONDON.—PARTNERSHIP.—A share producing over £1,200 p.a. with prospects, is for disposal owing to the retirement of one of several partners in a very old-established Practice. Ingoing partner would reside in pretty country district five miles from country town where main practice lies. No opposition. Total income £8,250 to £8,500 including valuable appts. worth about £2,000 and panel. Very desirable residence (ample accommodation) with 2½ acres of ground, on lease at low rent of £60. Premium 2 years purchase.

2 LONDON, SOUTH WEST.—Old established non-panel PRACTICE having good Ophthalmic connection and also scope for Ear, Nose and Throat work. Gross cash receipts for past 12 months over £1,400. Fees from 5/. Practically no midwifery but scope if desired. Good corner house in excellent condition with 4 reception, 5 bedrooms, etc. Price for long lease £1,500. Premium 1½ years purchase.

3 SOUTH COAST.—FAVOURITE HEALTH RESORT.—Well established mixed-class PRACTICE offering good scope. Average gross cash receipts over £700 p.a., including panel of 720. Very good house with 2 reception, 5 bedrooms etc. Nice garden. To be sold or might be let for a time. Premium 1½ years purchase.

4 HOME COUNTY.—PARTNERSHIP.—A share, at present producing about £400 p.a., but with prospects of an early increase as there is large scope is offered in a well established Practice, situated in attractive country district. Suitable house can be rented at £50 p.a. Premium 2 years purchase, part by arrangement.

5 YORKSHIRE.—GOOD TOWN.—PARTNERSHIP.—A one-half share (guaranteed to produce £2,000 p.a. in first year) is offered in a good middle class Practice. Income for the past twelve months approximately £4,000. Small select panel of 450. One appointment worth nearly £650 p.a. Fees 3/6 upwards. Opposition not strong. Suitable house can be bought or leased. Very good educational and sporting facilities. Premium 2 years purchase.

6 YORKS.—LARGE TOWN.—Old-established middle and working class PRACTICE averaging £1,778 p.a. Panel of 791. Fees 3/6 to 21/. Mid. 2 to 10 gns. (about 12 cases yearly). Suitable house, with 2 reception, 4 bedrooms etc. Separate entrance to professional rooms. Good schools and sporting facilities. Prem. 1½ years pur.

7 HOME COUNTIES.—PARTNERSHIP.—A third share, producing about £1,000 p.a. is offered in a well established good mixed-class Practice situated in very attractive district within 20 miles of London. Fees 3/6 to 2 gns. Suitable house available. Premium 2 years purchase.

8 LANCS.—PARTNERSHIP.—A one fourth share to commence (with increase up to one-half later) is offered in a very old established good middle class Practice producing for the last twelve months over £4,700 p.a. Panel of 2,730. Appts. worth nearly £200 p.a. Visits 2/6 to 12/6. Not much midwifery from 2 to 3 gns. Suitable house obtainable but if single purchaser can reside with Vendor, who is a bachelor. Premium 2 years purchase.

9 CAMBS.—PARTNERSHIP.—A one half share is offered in a sound mixed class Practice producing last year nearly £2,000. Panel of 765. Situated in pleasant agricultural district with good sporting facilities. Fees 5/ to 21/. Suitable house can be rented at £75 p.a. Premium 2 years purchase.

10 YORKS.—In small pleasant market town amidst pretty and prosperous surrounding country very old established mixed class PRACTICE averaging nearly £1,250 p.a. including panel and appts. worth over £450. Visits 3/6 to 25/. Opposition weak. Good house with ample accommodation and every convenience. Garden. Garage. Price £1,500. £1,000 on mortgage or would be let at £80 p.a. Premium £1,450. Educational and social amenities.

11 SOUTH WESTERN COUNTY.—Near the Sea.—Old established country PRACTICE in beautiful district within reach of Market Town and averaging £1,100 p.a. including appts. and panel producing £450. Exceptionally attractive modernized house in over 3 acres of ground with ample accommodation, productive fruit and vegetable garden with tennis lawn etc. Water laid on and electric light available shortly. Price freehold £3,000, part on mortgage. Premium £1,650. Sport of all kinds and schools within reach.

12 CLOS — COUNTRY PRACTICE — Old established PRACTICE in picturesque surroundings averaging about £1,250 p.a., including panel of over 1,100. Visits from 3/. Commodious house with 3 reception 6 bedrooms etc. Garden. Garage. Price for freehold £1,500. £1,000 on mortgage. Premium £1,850.

13 LONDON S.E.—Outlying Residential Suburb.—Very old established PRACTICE (hitherto carried on by two men in partnership) is for disposal or half share would be sold with succession to the whole in 12 months time. Receipts average about £3,000 p.a. including appts. worth £330 and panel over 1,500. Two houses available. Premium 1½ years purchase. Eminently suitable for two friends.

14 HANTS.—Delightful residential district within easy reach of Coast.—Good mixed PRACTICE averaging £970 p.a. and offering large scope as district rapidly developing. Panel of 230. Fees 3/6 to 15/. Well built well situated house with 2 reception 6 bedrooms etc. Garden, with tennis lawn. Moderate premium accepted for quick sale. Sport of all kinds and good social facilities.

15 AYRSHIRE COAST.—Village PRACTICE unopposed and situated in very beautiful district within easy reach of large town. Cash receipts last year £740. Panel of 303. Fees 2/6 to 21/. House faces sea, in own grounds, and contains sitting room 4 bedrooms, etc. Rent £40 p.a. Premium £1,000 part by arrangement.

16 BORDERS OF NORFOLK AND SUFFOLK.—PARTNERSHIP.—A half share (with succession in 2 to 3 years time) in a good mixed unopposed Practice in pleasant village near two good towns. Income for last 12 months £1,992 including panel of 1,000 and appts. worth about £150. Fees 2/6 to 10/6. House contains 3 reception 6 bedrooms etc. Sport of all kinds. Premium 2 years purchase.

NATURALLY RICH

IN VITAMIN "D"

A RELIABLE BASIS

THE above chart shows the large fluctuations in the fat content of liquid milks throughout the year, as compared with the unvarying fat content of "Cow & Gate," which is based on the fat content of average healthy Breast Milk

Fat content in "Cow & Gate" reconstituted (1 in 8), 3·4 per cent.
Fat content in average Breast Milk 3.3 per cent. to 3.5 per cent.

The fat content of raw milk also varies greatly from day to day The time of day at which milking takes place also causes considerable variations

This is in striking contradistinction to the standardized fat content of "Cow & Gate" and affords one of the many reasons why this food is the safest and most reliable alternative when breast feeding fails and why it also is the most reliable basis for Infant Feeding Modifications

Write for literature and a clinical sample of Cow & Gate.

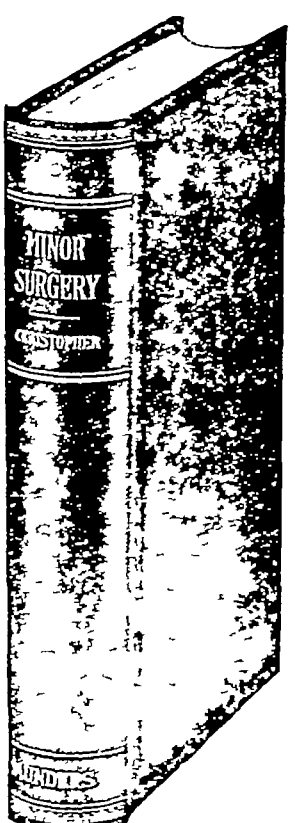
Books—The Best Christmas Gifts

Beckman's Treatment

There is no other book like it

"This book or its equivalent should be in the hands of every physician and we have not yet come across its equivalent"—THE LANCET

'The publication of Professor Beckman's book on Treatment will be welcomed by medical men and we owe a debt to him for having it introduced into England Bacon said Some books are to be tasted others are to be swallowed and some few are to be chewed and digested Professor Beckman's book is to be chewed and digested'—MEDICAL PRESS AND CIRCULAR



By HARRY BECKMAN M.D., Professor of Pharmacology Marquette University Milwaukee. Octavo 899 pages. 45s. net.

Christopher's Minor Surgery

"Sound advice,
"Superb illustrations,
"Invaluable"

"This is a very good book Its arrangement follows the usual lines except for the welcome addition of a long chapter designed for The Surgical Intern' This is full of sound advice which may be read with profit, not only by the house surgeon but also by his chief and is mostly applicable to residents in our own hospitals The book is admirably printed on excellent paper and the illustrations are superb The consulting surgeon and the practitioner will find much to interest them while the house surgeon will find it invaluable—THE LANCET

By FREDERICK CHRISTOPHER, M.D., F.A.C.S. Associate in Surgery North western University Medical School Chicago With a foreword by ALLEN B KANAVEL, M.D F.A.C.S., Professor of Surgery Northwestern University Medical School Octavo of 694 pages with over 600 illustrations on 465 figures Cloth 36s. net.

W. B. SAUNDERS COMPANY Ltd.
9, Henrietta Street, London, W.C.2

LEWIS'S PUBLICATIONS

EIGHTH EDITION With 2 Plates and 91 Illustrations Demy 8vo 21s net, postage 9d

HYGIENE AND PUBLIC HEALTH

(PARKES and KENWOOD)

Revised by H R KENWOOD, M B F R S Edin , D P H Lond , Emeritus Professor of Hygiene and Public Health, University of London, and H KERR, M D Edin , D P H Camb , Professor of Hygiene and Public Health in the University of Durham etc

The task of revision, and especially of addition has been well performed —BRITISH MEDICAL JOURNAL.

As necessary as a Stethoscope

The present-day physician can ill afford to dispense with a sphygmomanometer as part of his visiting equipment. Many of the greatest medical minds of to-day advocate blood pressure tests as a guide to the eventual diagnosis.

The question of portability is easily solved by the S & M Portable type of Sphyg as illustrated. This instrument—including Patent Arm Sleeve and Inflating Bulb with Control Valve—is contained in a leather carrying case 7 in. long, 4 in. wide by 3 in. deep.

Write for full details and prices

Every genuine instrument bears the trade mark "Tycos" engraved on the dial

Obtainable from all reputable Instrument Dealers.

THE POSTAL ACCOUNT

It is often supposed that to live a long way from the nearest branch of a bank, or to be constantly unable to go to the bank in person, is a handicap to the enjoyment of the full advantages which, it is admitted, a banking account offers. Perhaps it is assumed that to conduct an account by post involves 'more letter writing', or is costly, or is not welcomed by the Bank. It is the aim of the Westminster Bank to dispel such misconceptions by a leaflet entitled *The Postal Account*, which explains the convenience of the method, and offers some clear suggestions.

The Secretary of the Bank will be pleased to send a copy on application.

MODERN MEDICAL MONOGRAPHS

Designed specially for the practitioner

HEART DISEASE IN CHILDHOOD

by

H B RUSSELL, M D M R C P and C K J HAMILTON, B M M R C P

Demy 8vo 104 pages 7s 6d net

Heart disease presents special problems in the child not only because of the difficulties in the diagnosis and management of cases of congenital heart disease but also—and a much more important reason—because it is in childhood that the acute infective phase of rheumatic heart disease most often occurs and on the treatment of that phase may depend the outlook of the patient's whole life

"The authors have treated their subject in a lucid and most able manner discussing the problems with which every practitioner has to contend, and explaining methods of diagnosis and treatment."—MEDICAL TIMES

"This book will be warmly welcomed dealing as it does with a subject which is *engaging so much attention at the present time*."—NURSING TIMES

MODERN METHODS OF FEEDING IN INFANCY AND CHILDHOOD

by

D PATERSON B A M.D F R C.P and J FOREST SMITH, M P C P

Demy 8vo 162 pp Second Edition 7s 6d net

"The first edition appeared in 1925 and has well established itself as one of the most *useful and practical* of the shorter books on this subject. The second edition is largely by some 40 pages and contains additions which considerably increase its utility and completeness. These *chapters are admirably clear and practical*, giving definite indications of quantities required and stressing common diet tic errors such as excess of carbohydrate and of milk."—LANCET

"It constitutes a very complete guide in all the difficult details of dieting a delicate infant."—NURSING MIRROR.

"It will certainly prove to be a popular book because it is *concise and dogmatic* and *expresses* opinions in an *easily remembered fashion*."—BRITISH MEDICAL JOURNAL.

MODERN VIEWS ON DIGESTION AND GASTRIC DISEASE

HUGH MACLEAN, M D D Sc F R C P Second Edition 12s net

The present day position of gastric physiology and pathology is here presented in a most lucid and able manner. Professor Maclean emphasises the fact that intelligent treatment of gastric diseases must be based on physiological knowledge. In this monograph he also gives full details for medical treatment of duodenal ulcers and proves that recourse to surgical measures is not generally necessary in order to bring about successful results

"It is no surprising that Prof. Hugh Maclean's volume entitled *Modern Views on Digestion and Gastric Disease* has rapidly passed into a second edition."—BRITISH MEDICAL JOURNAL.

"It presents an excellent résumé of present-day knowledge and the author's experience enables him to give much practical advice on diagnosis and treatment."—PRESCRIBER.

"The general reading of the book by practitioners of *general medicine* will greatly improve the standards of practice in this difficult subject of gastric disease."—CANADIAN JOURNAL OF MEDICINE AND SURGERY

MODERN METHODS IN THE DIAGNOSIS AND TREATMENT OF GLYCOSURIA AND DIABETES

HUGH MACLEAN, M D D Sc F R C P Fourth Edition 12s net

"Of the successful series edited by Prof. Hugh Maclean of *Modern Medical Monographs* the first by him if on Glycosuria and Diabetes was brought out in 1922 and is now in its fourth edition a testimony to its popularity which almost absolves the reviewer from further comment."—BRITISH MEDICAL JOURNAL.

MODERN METHODS IN THE DIAGNOSIS AND TREATMENT OF RENAL DISEASE

HUGH MACLEAN M D D Sc F R C P *Third Edition* 12s net

"This extremely useful handbook is both scientific and thoroughly practical and thus has rightly been recognised as a book to buy and keep at hand for reference and advice in emergencies."—BRITISH MEDICAL JOURNAL.

THE ENDOCRINES IN GENERAL MEDICINE

by

W LANGDON BROWN M A M D F R C P

Demy 8vo 152 pages 7s 6d net

This little book is written primarily for the general practitioner who will find in it an account of the endocrine system and its diseases presented in a form which should certainly be of service to them.—LANCET

BACTERIAL VACCINES AND THEIR POSITION IN THERAPEUTICS

by

LEONARD S DUDGEON, C M G C B E F P C P

Demy 8vo 96 pages 7s 6d net

"This book should prove most helpful to all those who are interested in the subject."—BRITISH MEDICAL JOURNAL.

"We can confidently recommend this handy and up-to-date volume on vaccine therapy."—MEDICAL TIMES

MODERN METHODS IN THE DIAGNOSIS AND TREATMENT OF PULMONARY TUBERCULOSIS

by

R C WINGFIELD B A M B (Oxon) F R C.P

Demy 8vo 144 pages 10s 6d net

"It is definitely addressed to the general practitioner and in short compact dogmatic chapters it presents just the information and guidance which the average medical adviser will appreciate.—BRITISH JOURNAL OF TUBERCULOSIS

MODERN VIEWS ON THE TOXAEMIAS OF PREGNANCY

by

O L V de WESSELOW, M B F R C P and J M WYATT M B F P C P

Demy 8vo 108 pages 7s 6d net

"The authors have succeeded in collecting and presenting in a readable form the more important facts gained from recent scientific research and this book will certainly afford some guidance in the management of difficult cases.—B M J

MODERN DIAGNOSIS AND TREATMENT OF SYPHILIS CHANCROID AND GONORRHOEA

L. W HARRISON D S O M B Ch B M R C P E Demy 8vo 176 pages 10s 6d net

"This is a handy volume written by an admitted authority on venereal disease. It deals with the clinical diagnosis prevention and treatment of syphilis including a useful chapter on the management of syphilis the general principles treatment of gonorrhoea are clearly presented and modern methods of treatment lucidly described."—BRITISH MEDICAL JOURNAL.

"It gives a lucid and concise account of syphilis chancroid and gonorrhoea in all their manifestations and with the sections on diagnosis and treatment no fault can be found. To the busy practitioner who cannot overtake the enormous literature it should be very useful."—LANCET

For Producing Therapeutic Fever

(*Pyretotherapy*)

Introducing the Victor Super-Power Vario-Frequency Diathermy Apparatus, having a power output considerably greater than that of any other diathermy apparatus

ALTHOUGH the use of artificially produced fever in the treatment of certain diseases has held the interest of the profession for some years past, considerable stimulus has been given the subject more recently, through published clinical reports based on the use of diathermy as a method of raising the body temperature.

The authors summarize their article* as follows

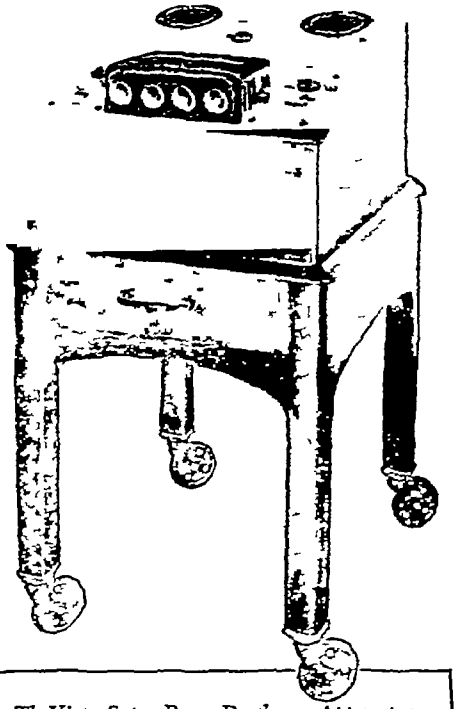
"There is reason to believe that this form of treatment will be useful in any of the many diseases where pyretotherapy is indicated.

"In the following list we enumerate the chief advantages of this form of pyretotherapy

(1) It is always available.

(2) No pathogenic organism of unknown effect is injected into the patient.

(3) The frequency, duration and intensity of the febrile paroxysms are under accurate control.



(4) The desired elevations can be produced in all cases, which is advantageous in cases that have an immunity to malaria

(5) Drug therapy can be used in conjunction with this form of pyretotherapy if desired.

(6) Since the frequency duration and intensity of the fever can be accurately controlled, the reaction produced in each patient can be more nearly standardized. This will enable us to learn the most favorable temperature curve.

*Therapeutic Fever Produced by Diathermy with Special Reference to its Application in the Treatment of Paresis South Med. Jour., Mar., 1930

A copy of this reprint in full will be mailed on request, together with further information on the Victor Diathermy Apparatus as designed for this work.

The Victor Super Power Diathermy Apparatus Designed for Producing Therapeutic Fever

Capable of raising the body temperature to the desired degree, under absolute control of the operator at all times.

Will give as much current as any patient can tolerate through the chest and abdomen with the largest size electrodes used thus far in this work.

With a control system which permits the selection of both frequency and voltage, the quality of current desired is quickly available.

This refinement of control applies throughout the range of the machine from the low current values up to and including the high. Thus the outfit serves every purpose of diathermy known to medical science up to the present.

It is shock proof! The control panel is so designed that there are no exposed parts to endanger the operator or patient.

MICKLEFIELD IRRADIATED MILK

TREATING THE COW

By this Process—

(1) VITAMIN A AND NATURAL FLAVOUR ARE PRESERVED
(2) VITAMIN D CONTENT IS INCREASED 1,800 PER CENT., OR TEN TIMES THAT OF ANY OTHER IRRADIATED MILK

One pint equivalent in Vitamin D to 600 drops or 12 grammes of average Cod Liver Oil

A ten weeks test recently conducted at the Infants School Rickmansworth under the supervision of the Medical Officer of Health gave the following results:—

(1) 10 children (control) had their usual ordinary milk
(2) 29 ,, ,, ,,

EPHEDRINE B.D.H.

For Cold in the Head

BDH Ephedrine preparations provide a ready means of giving prompt relief and comfort to patients suffering from nasal congestion and other unpleasant symptoms of the common cold

To suit the convenience and idiosyncrasy of individual patients, Ephedrine may be prescribed in any of four forms

Ephedrine B D H.
Elixir
A palatable preparation containing ¼ grain of the hydrochloride of Ephedrine BDH per fluid drachm

Ephedrine B D H
Inhalant Compound
A solution of Ephedrine BDH with camphor, menthol and oil of thyme in liquid paraffin

Ephedrine B D.H.
Nasal Jelly
Containing Ephedrine BDH in pure petroleum jelly

Ephedrine B D H.
Throat Spray
An aqueous solution of the hydrochloride of Ephedrine BDH

Clinical sample of any of the above can be obtained on request from the makers

DIMOL SNUFF

A convenient and efficient bactericide in all infections of the upper respiratory tract, especially as a preventive to invasions by the germs of

The Common Cold — Chronic Nasal Catarrh

B influenzae — M catarrhalis — Streptococci — Pneumococci

LABORATORY TESTS

Dimol Snuff has a coefficient equivalent to 30% pure phenol—that is, it is as active as a bactericide as pure phenol diluted with twice its volume of water—a strength of phenol of course quite intolerable in the respiratory tract.

Dimol Snuff diluted with 10 times its bulk of mucus will kill

Pneumococci in 30 seconds
B influenzae in 30 seconds
M catarrhalis in 35 seconds.
Streptococci in 40 seconds

Prices and particulars will be sent on application to

DIMOL LABORATORIES LTD 40, LUDGATE HILL LONDON E C 4

FOR . . . changing the intestinal flora . . . supplying bulk and lubrication

Lactose 73%, dextrin 25% —that is the proportion in which these carbohydrates are combined in this new food for changing the intestinal flora Both are more slowly absorbed than other carbohydrates, and both are able to reach the colon in sufficient quantity to cause a luxuriant growth of protective flora An acid reaction of the intestinal contents unfavourable to toxic organisms is thus produced —Lacto-Dextrin being highly efficient in promoting the growth and development of both B acidophilus and B bifidus in the colon In this pure carbohydrate food both lactose and dextrin are presented in a palatable and agreeable combination

PSYLLA

an accessory for use in conjunction with Lacto-Dextrin

Where bulk and lubrication of the intestinal tract is also required, the use of BATTLE CREEK Psylla (Plantago Psyllium) is invaluable as an accessory The small brown seed when in contact with water swells into a soft gelatinous mass and acts most effectively both as an emollient and intestinal evacuant.

Samples and literature of both these intestinal products will be sent to members of the Medical Profession on request to Coates & Cooper 41 Gt Tower St London, E.C.3 Sole Distributing Agents for the United Kingdom and Irish Free State.

LACTO-DEXTRIN

Manufactured by the BATTLE CREEK FOOD CO, Mich., U.S.A.

In General Debility

"Glycerophosphates favour the assimilation of phosphates from the food and protect the combined phosphorus of the nervous system from wasting"

Prof A Robin

"In Sanatogen we are offered an ideal combination to combat the wasting effect of chronic or acute illness In fact, a better cell-reconstituent can hardly be imagined, for the casein and glycerophosphates in combination fulfil every demand for perfect nutrition"

PROF GOLDWATER in "Therapeutic Medicine"

"I have used Sanatogen and am very pleased with the results obtained."

PROF VON EISELSBERG of Vienna, recipient of the Lister Medal, July, 1927

The Prevention of Bacterial Infection

It is now a generally accepted fact that the human subject depends for health upon a supply of vitamins when this supply is inadequate the resistance against bacterial infection diminishes For example it has been found that, when the supply of Vitamin A is deficient, functional activity of the mucous membranes is impaired, the result being that bacteria associated with such infections as the common cold influenza etc., are able to penetrate and to produce a toxaemia. It is logical, therefore, that Vitamin A should be a valuable prophylactic against such infections

A medium through which the physician can ensure Vitamin A in scientifically-measured proportions for his patients is Radiostoleum this product possesses also the advantage of its accurately-standardised content of Vitamin D Alternatively the prophylactic against bacterial infection most suitable for general family use is the physiologically-standardised preparation Radio Malt, which contains Radiostoleum together with properly-balanced proportions of Vitamins B_1 and B_2

A safe and simple antacid which is also a gentle laxative must necessarily be of great value to medical practitioners when administering to ladies and children and all who are constitutionally delicate

May we, therefore, venture to remind you of

DINNEFORD'S PURE FLUID MAGNESIA

which has been extensively prescribed and used by the Medical Profession for a Century and is still the best and safest means of administering Magnesia.

When prescribed for the nursery too, Dinneford's Magnesia has always proved immensely useful as a corrective, and when mixed with infant's food it prevents many of the troubles which are due to acidity flatulence, etc.

We are confident that you will find in Dinneford's Fluid Magnesia a reliable and safe solution which may be freely used for many ailments, and we would request your kind consideration of its use as occasion offers.

Dinneford's Pure Fluid Magnesia possesses antacid and laxative qualities which are incomparably better than those of any of the various preparations of Magnesia, in powder, now being introduced

It cannot harm the most delicate constitution and is at all times a safe and effective laxative

Manufactured in London for the past 100 years

DINNEFORD & Co LTD

Invaluable as a Galactagogue

This nourishing and sustaining food drink is helpful to nursing or expectant mothers

NOT only hundreds, but literally thousands of cases are recorded in which this well-known preparation — Horlick's Malted Milk — has proved its efficiency as a body building food

It is particularly valuable as an addition to the diet of the expectant and nursing mother For Horlick's is a perfectly balanced food containing fat, proteins and soluble carbohydrates combined together in correct nutritive ratio It is prepared from fresh, full-cream cows' milk, selected wheat and malted barley — and, during manufacture, is partially predigested to ensure easy assimilation

Horlick's is rich in valuable malt-sugars, but contains neither cane sugar nor free starch It is therefore extremely easily digested, and highly productive of energy

These characteristics make it valuable as a galactagogue Its abundant nutriment supplements any deficiencies in the mother's regular diet, and promotes a regular and nourishing supply of milk, and its easy digestibility makes it acceptable when other forms of nourishment are unwelcome

Taken during pregnancy, it builds up the mother and helps to maintain her vitality A cupful taken regularly first thing in the morning frequently abolishes and almost invariably alleviates the discomfort of morning sickness

Horlick's is now obtainable in two forms — the original, natural-flavoured Malted Milk, and the new Chocolate Flavoured form — identical in its constituents with the original Horlick's, but flavoured with fine chocolate Horlick's is sold in sealed glass bottles, price 2/-, 3/6, 8/6, 15/- Also in tablet form

Further details may be obtained from Horlick's Malted Milk Co, Ltd, Slough, Bucks

MEDULLA RUBRA

BONE-MARROW IN ANAEMIA FROM HAEMORRHAGE

W Borchardt (*Deut. med Woch* March 28th, 1930 p 521) records the results of his experiments on young dogs in which anaemia had been artificially produced by the removal of about half their blood. In the first series some of the animals were fed with rib-marrow others with marrow from the long bones. Control animals received a corresponding amount either of fat or of liver extract. The basal diet in each case contained a sufficiency of iron (5 mg per cent) Only the animals receiving the red rib-marrow showed a definite increase of weight, and their haemoglobin formation was more rapid than that of the others. In the next series the experiment was repeated but the iron content of the diet was reduced to 1 4 mg per cent The result was similar but more striking the dogs receiving the rib-marrow regaining their haemoglobin far more quickly than the others.

THIS extract from the "Epitome of Literature" published in the "BRITISH MEDICAL JOURNAL," dated May 3rd last, is important as representing in 1930 a complete justification of the formula upon which

Roboleine

THE FOOD THAT BUILDS THE BODY

has been produced without variation during the past twenty five years

The success of ROBOLEINE is thus due to intelligent anticipation and to consistently maintaining the highest possible standard of manufacture

Medical Practitioners are asked to satisfy themselves of the merits of ROBOLEINE for which purpose testing samples will be gladly sent upon request.

Successful Treatment of Hyperchlorhydria and Associated Conditions

Alocol (Colloidal Hydroxide of Aluminium) has proved remarkably successful in the treatment of hyperchlorhydria gastric ulcer fermentative dyspepsias with gastro-intestinal flatulence acid eructation and other symptoms common to gastric disease

The advantages of Alocol are that it actually removes from the system the causative acid radicle (Cl) instead of merely neutralising it and so permitting reabsorption accumulation and consequent recurrence of the symptoms of the disease

Furthermore Alocol neither hinders proteolysis nor causes destruction of any food element or factor Alocol has a distinct healing and sedative effect it promptly allays irritation by absorbing acid and other irritants

Complete chemical history of "Alocol" with convincing clinical reports and supply for trial, sent free to physicians on request.

A. WANDER, Ltd., Manufacturing Chemists, 184, Queen's Gate, London S.W.7

Works KING'S LANGLEY HERTFORDSHIRE M231

ALOCOL

Colloidal Hydroxide of Aluminium

Distinct Advance Over Preparations of Acetyl-Salicylic Acid

Acetyl salicylic acid possesses a notable disadvantage Physicians have proved that it cannot be tolerated by patients suffering with a delicate stomach Consequently the value of this medicament in the wide field in which it is indicated is very seriously reduced

Alasil completely overcomes this objection By combining calcium acetyl salicylate with Alocol unfavourable secondary action upon the stomach is prevented This beneficial influence is undoubtedly due to the presence of Alocol (Colloidal Hydroxide of Aluminium) which preparation has brilliantly stood the test of practice in the treatment of hyperacidity and other ill conditions of the gastric tract

Alasil" is therefore a triumph over acetyl salicylic acid It enables higher doses to be administered and maintains the patient's system under its influence for a greater length of time Analgesic Antipyretic and Sedative Alasil' is indicated in all cases where acetyl salicylic acid has been used heretofore

A supply for clinical trial with full descriptive literature sent free on request.

WHAT THIS DOCTOR SAYS ABOUT RYVITA

To RYVITA CO LTD
96 Southwark St., London, S.E.1

—— Hospital
—— Scotland

14/11/30

Dear Sirs

I should like to express my appreciation of Ryvita I think it is a most excellent food and is all that it is advertised to be. It is very easily digested and therefore a valuable asset in the diet of the dyspeptic individual It can replace bread in such a case, and I have found it invaluable where the patient complains of constipation as a symptom

The two Sisters here are loud in their praise of Ryvita, and would take it to every meal if that were possible The white bread and even the brown goes away untouched when toasted Ryvita is on the table

You may use this testimonial for any purpose. For obvious reasons I do not wish the name, etc. of the originator published but you may show this to anyone.

Thanking you for patients samples

I am yours truly (Signed) —— M.B., Ch.B D.P.H.

THE "LANCET"

IN ITS REPORTS AND ANALYTICAL RECORDS said of

RYVITA

CRISPBREAD

"There is more character in the flavour of rye than of wheat, and the food value of the former (rye) needs no comment.

On analysis (of Ryvita) the following results were obtained—

	Per cent.		Per cent.
Carbohydrates altered starch hemicellulose, etc.	74 8	Ash	1 8
Protein	11 6	Fat	1.3
Moisture	9 0	Fibre	1.5

Calorie value per lb—1662

"RYVITA CRISPBREAD, which keeps well and does not readily become slack is easily masticated and digested, and is a useful and palatable addition to the diet. The calorie value shows it to be a concentrated form of food.

In Analysis and Energy Value of Foods" it is shown that in 12 tests of white bread and 5 tests of brown (wholemeal) bread the average value in calories was —1 lb white bread, 1036 9 calories 1 lb brown bread, 1012 4 calories but the "Lancet" analysis above shows — 1 lb RYVITA CRISPBREAD 1662 calories.

INFLUENZA and COLDS

The latest researches on Influenza in England and America point to a pleomorphic streptococcus of the viridans type as the primary cause of this disease. The workers in the Pickett-Thomson Research Laboratory, St Paul's Hospital, London, have constantly found this streptococcus not only in cases of true influenza but also in the nasal discharge of cases of the common cold It would appear, therefore, that many ordinary colds are merely mild forms of true influenza.

Extremely good results have already been achieved both in the prevention and treatment of influenza and colds with *a new detoxicated vaccine containing only the pleomorphic* streptococcus in question.

This vaccine has given striking results in the treatment of the troublesome cough which accompanies and follows most cases of influenzal colds.

PLEOMORPHIC STREPTOCOCCUS VACCINE (Detoxicated) is put up in 1 c c ampoules, also in 5 c c, 10 c.c, and 25 c c rubber-capped bulk bottles Practitioners desiring information regarding dosage, prices, etc, are invited to write to

The most efficient Peptonising Powders!

Half a tube of Benger's is enough!

While half a tube of Benger's Peptonising Powders is enough to peptonise a pint of milk, gruel or soup, in most cases in 10 minutes, the extent of the peptonising action can be regulated by either increasing or diminishing the quantity of the powders, and by lengthening or shortening the time during which they are allowed to act on the milk, gruel etc

Generally speaking, Benger's Peptonising Powders produce the required result with half the quantity necessary of other preparations, whose initial cost also is higher

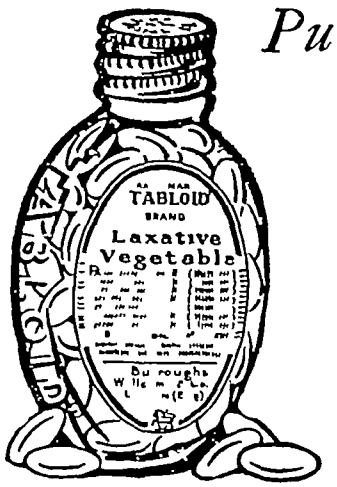
A Vitamin-containing food —and very much more

WHILST the presence of vitamins in food is rightly recognised as essential, their presence is a minimum and not a maximum requirement Whilst Virol contains all the vitamins, it does not, like so many foods, found its claim to medical attention on its vitamin content alone

In Virol the relative proportions of Protein, Fat, Carbohydrate and Mineral Salts are carefully adjusted For it is recognised that the absence or deficiency of one element leads to the inefficient absorption of the other food elements present in the diet Thus——

Virol is a food complete in itself and correctly balanced

A Food, again, must be judged by the amount and nature of the products of its digestion that ultimately reach the blood In Virol the fat is presented in the form of a highly digestible emulsion, and the proportion of protein is adjusted so as to avoid derangement of nitrogenous metabolism



The proof that Virol conforms to all the essential canons of the science of nutrition is seen by the fact that

VIROL

is used in over 3,000 Hospitals & Welfare Centres

INSTRUMENTS REPRODUCED FROM A MANUSCRIPT WORK OF ALBUCASIS, THE GREATEST ARABIAN SURGEON.—Oriental repugnance to opening the body and drawing blood prevented the Arabs from contributing greatly to the progress of surgery. They used cauteries generally in place of the knife in cancer and other growths, in gangrene for the opening of hepatic abscess and in carious inflammation of the hip joint. They had for this purpose an extraordinary number of instruments. Albucasis however made a valiant effort to revive the practice of surgery convinced that in this direction lay the chief possibility of new progress in medicine. In the great surgical treatise from which the accompanying figures are drawn and which was for a large part of the Middle Ages the leading text book on the subject he thus laments the neglect of surgery. "The operative art has disappeared from among us almost without leaving any trace behind. Only in the writings of the ancients do we find some references to it but these, by bad translations by errors and alterations have become nearly unintelligible and useless." The instruments here figured are a pair of concave scissors for the removal of tonsils, and an obstetrical appliance.

HOLLOW NEEDLE USED FOR THE REMOVAL OF CATARACT BY SUCTION

The Arabians were earnest workers in ophthalmology They have left careful descriptions of their operations and illustrations of a least thirty-six oculist s instruments Cataract was generally removed by depression of the lens into the vitreous Cure by suction is described by Isa ben Ali in the work from which the accompanying illustration is reproduced. Of him an ancient Arabian historian records "Ali ben Isa or Isa ben Ali a consummate oculist, composed a book entitled *Tedkirat el Kahhalin* (The Oculist s Memorial) a celebrated book, indispensable to every oculist and universally accepted to the exclusion of all others He died in the four-hundredth year of the Hegira. Cure by suction had already been mentioned by Rhazes and by Albucasis who had noticed the practice in Iraq An eleventh century Arabian oculist, Omar ben Ali seems to have employed this method At the point of the instrument here figured is the direction "This part is introduced into the eye and at the open end Through this part the cataract passes out.

A Paper
ON
THE TREATMENT OF CANCER OF THE RECTUM WITH RADIUM*

BY
SIR CHARLES GORDON-WATSON, K.B.E., C.M.G., F.R.C.S.
SURGEON TO ST. PETER'S, ST. PAUL'S, AND TO THE MARIE CURIE HOSPITAL FOR DISEASES OF THE RECTUM

RADICAL surgery for cancer involves some mutilation of the human body. The appeal which radium makes to both surgeon and patient is the hope of a cure without disfigurement.

In cancer of the tongue, the larynx, the breast this appeal is outstanding. Much has been accomplished to substantiate the claims of radium *versus* surgery in these situations, though they are not yet so firmly established as to be unassailable.

If radium treatment of rectal cancer can be raised to the same level, and if it can supplant radical surgery, it must be able to cure the disease without a permanent colostomy, and to leave a rectum which can function. This ideal, though possible in certain instances, as I have shown, is a long way off. Nevertheless it is on to be aimed at, and justifies intensive research. It is generally recognized that the present method of radical surgery for cancer of the rectum in its early stages cures a high percentage of cases, but they involve the stigma of colostomy.

Spread of Cancer of the Rectum

The recent work of Dr. Cuthbert Dukes on the spread of cancer of the rectum suggests that it is not necessary to excise the rectum completely, and establish a permanent colostomy for an early carcinoma which has not penetrated the rectal wall. Dr. Dukes has shown on histological evidence based on a hundred consecutive specimens of excised rectum that lymphatic invasion does not occur until the growth has *penetrated through the longitudinal* coat, and further that the line of spread is in the main to the retrorectal space and upwards along the superior haemorrhoidal. So far as this series of cases can be relied on to represent the average, the lines of lateral and downward spread along the middle and inferior haemorrhoidals are negligible. These observations, if confirmed in a further series of cases, are of the utmost importance, and have an important bearing on treatment either by irradiation or by radical surgery.

Local Resection for Early Carcinoma

If the growth can be removed freely by some form of local resection, and the rectal passage maintained, this method may be justified on histological grounds, whether or not a temporary colostomy is required. The view which has held ground for twenty years or so, that however early the carcinoma, complete removal of the rectum and perirectal lymphatics is essential, must be reconsidered, and the methods of thirty years ago may perhaps be reintroduced.

Acting on these views I have treated the last three cases of quite early mobile carcinoma of the rectum by local resection, one without a colostomy, and two with a temporary colostomy. Time alone will show whether this procedure, based on histological evidence, is justified by ultimate results. It may be mentioned here, however, that the results of Harrison Cripps over twenty years ago, and Cuthbert Dukes in more recent years, show that results of operations less radical than now usually considered necessary are remarkably good.

Can radium treatment of an early carcinoma compete with a local resection which aims at avoiding a permanent colostomy? These three cases could have been dealt with quite easily and thoroughly by interstitial irradiation. Two of them were amenable to vaginal irradiation, and the other to posterior barrage after resection of the coccyx. That these were not so treated, in spite of some success in similar cases, is due to the fact that it was impossible to give any promise that radium would be successful.

Irradiation of an Early Growth

Sufficient evidence has been obtained in my series of cases to show that an early growth of the rectum can be destroyed with radium without colostomy (or with a temporary colostomy) and without interference with the function of the rectum, though no observations are available, *on a five year basis, as regards recurrence*. If, however, local resection with little or no immediate mortality, and without permanent colostomy, should replace radical excision for similar cases, it would be difficult to advocate radium in preference, because experience shows that adenocarcinomas vary *considerably in radio-resistance and in* their response to radiation, and so, unfortunately, the result which may be anticipated with radium in any given case cannot be predicted.

The ultimate result as regards function of the rectum after irradiation of a growth varies according to the degree of fibrosis which results, and whether a fibrous stricture follows or not. The smaller the growth dealt with, the better the prognosis as regards stenosis. Small growths can be destroyed with little or no deformity of the lumen. The degree of fibrosis depends also on variations in reaction. An overdose may cause necrosis and excessive fibrosis with resultant stricture, but a correct dose may secure a perfect anatomical result. When this happens, new epithelium grows over the irradiated area, and it may be difficult on digital examination to recognize any abnormality of the *lumen beyond a slight projecting ridge*.

Alterations in the lumen of the rectum result from local resections, and fibrous strictures are very liable to follow, unless great care is exercised in avoiding sepsis during healing, and unless any tendency to stricture is checked by careful dilatation during convalescence. Thus if a local resection is preferred to treatment by radiation it is not certain that a permanent colostomy can be avoided.

When the operative risks of radical excision as distinct from local resections are considered especially in cases where the risks are above the average, *the arguments* in favour of radium are more worthy of consideration. If adenocarcinoma, like squamous-celled carcinoma of the *tongue*, can be graded as they have been by Broders into radio-sensitive and radio-resistant, the arguments in favour of radium in selected cases may be enhanced.

Furthermore if research should reveal some method of sensitization which can be relied on, there will be a wider field for the use of radium in preference to surgery. At the present time the number of cases dealt with in this class does not justify a too dogmatic opinion. The result in any given case depends on the delivery of an optimum dose, which is dependent on the correct amount of radium, the correct distribution, the correct filtration, and correct time of exposure.

Several unexpected failures have been encountered in *the irradiation of early growths*. Fortunately in most instances these failures can and have been made good by radical surgery, but unless it can be shown that preoperative radiation increases immunity against recurrence, patients so treated may have cause for complaint. Until a much larger series of early cases comes under review it is reasonable to assume that unexpected failure (such as two apparently similar growths treated on supposed identical lines, responding in one case well, in the other badly) may be explained in part by some error in technique, and not entirely by variation in radio-resistance.

Treatment of an Operable Growth

A small operable growth in the rectum below the peritoneal reflection, and clear of the anal canal, can if it involves the anterior or lateral wall in the female be attacked through the vagina. In the male the best approach is from behind, after removal of the coccyx. The rectum can be mobilized, so that the growth becomes accessible whether posterior, lateral, or anterior. The same approach is employed for the female if the growth is posterior. If the growth, though small, has commenced to ulcerate there is a risk of lymphatic spread, whether

*Read in opening a discussion in the Section of Surgery at the Annual Meeting of the British Medical Association, Winnipeg, 1930.

the posterior or vaginal route is employed the retrorectal space should be radiated

If a very small growth is encountered and found to be malignant, and the mobility of the growth is such that it can be freely mobilized from the muscular wall, it may be treated with some confidence by the introduction of intrarectal seeds without surgical exposure and without glandular attack Nevertheless, local resection without colostomy offers in all probability a more certain cure

During the past five and a half years, up to the end of June, I have treated 121 cases of cancer of the rectum with radium The majority of these have been regarded as inoperable, but lest it should be supposed that radium has been preferred to surgery, when surgery was indicated, it may be mentioned that over sixty cases have been submitted to radical surgery during the same period, and a considerable number have been submitted to colostomy only, owing to the presence of secondary visceral deposits

A few quite small early carcinomas have been treated by intrarectal seeds, or by vaginal irradiation with needles, with complete success, and without colostomy Others, more advanced but still operable, have been apparently cured either by a posterior barrage or by vaginal irradiation, or a combination of the two, some with a preliminary colostomy and others without

On the other hand, as already stated, some of the operable cases which seemed to offer every prospect of cure have responded indifferently, and have been submitted to excision at a later date Undoubtedly, some adenocarcinomas are more resistant than others The rapidly growing adenocarcinoma in a young person is more radio-sensitive than a slow-growing growth in an elderly patient, and is also more liable to recur after resolution

The number of cases definitely regarded as operable which have been submitted to radiation is too small, and the length of time that these have been under observation is too short to enable me to form any very definite opinion as to end-results Excellent results have to be set off against unexpected failures, and at the present time it seems impossible to predict the immediate result in any given case Even in those patients who remain well without colostomies, and with apparently healthy rectums, the question of future recurrence is still *sub judice*, and on a less secure foundation in all probability than after a local resection

Difficulties

The obstacles to efficient irradiation are

1 *Anatomical Difficulties* —In the case of the tongue or breast it is comparatively easy to secure a complete barrage of the growth, the outlines are visible, and the lymphatic areas are reasonably accessible In the case of the rectum, unless the growth is small and low down, there are great obstacles to a complete barrage both of the growth and of the lines of lymphatic spread

2 *Radio-resistance* —Experience seems to indicate that columnar-celled carcinoma is more radio-resistant than other types Anatomical difficulties are no doubt responsible in some measure for the failures recorded and for the unfavourable views which are held on the radio-resistance of this type of growth My experience leads me to believe that the dosage required to secure complete retrogression of columnar-celled carcinoma is very near the margin of tolerance of the healthy tissues Consequently radium burns are difficult to avoid and beta-radiation must be reduced to a minimum

Filtration

Most of my work has been done with filtrations of 0·5 or 0·6 mm platinum Recently I have been using 0·8 mm in some cases, and I intend, when an increased supply is available, to use only this filtration for rectal carcinomas for the present If necrosis results, perforation of the rectal wall and sepsis are liable to follow, and even if a cure follows, the period of convalescence is a very long one By increasing the filtration so that all primary beta rays are excluded, it is possible to employ a much larger dose of radium than with either 0·5 or 0·6 mm filtration without risk of necrosis

I like to leave the radium in for ten days in the hope that every cancer cell will be exposed to radiation of a constant intensity during a period of mitosis Uniform intensity cannot be obtained with radon, this is a great disadvantage in the use of seeds, which in other respects have so many technical advantages

Effect of Chronic Sepsis

It sometimes happens that an operable growth which has been treated without a colostomy retrogresses up to a point and then appears to remain stationary owing to chronic sepsis This is illustrated by the case of a woman with a growth on the anterior wall of the rectum treated at St Mark's by vaginal irradiation without colostomy Response was inadequate, and a second treatment was carried out by vaginal irradiation both with needles and with intrarectal seeds two months later No apparent appreciable change followed after three months, and I excised the rectum Dr Dukes reported that in his opinion the case would have been completely cured if it had been left a little longer, because there was practically no carcinoma active and the few carcinoma cells found were disintegrating The general microscopic characters were those of a chronic inflammatory ulcer Before treatment a section showed that the growth was a typical adenocarcinoma It is probable that this case would have been cured with radium in reasonable time if a colostomy had been done in the first instance

Reaction of Rectal Growths to Radium

One of the disadvantages of radium treatment combined with surgery consists in the length of time (often two months and more) which these growths usually take to retrogress and disappear While evidence of growth remains, there is uncertainty as to the end result When all visible growth has gone, a varying amount of fibrosis remains Uncertainty as to whether any growth remains in the interstices of these fibrous nodules cannot be avoided

Further, when operative exposure from behind has been the method employed, the wound usually takes as long to heal or longer as compared with a radical excision A long operative convalescence can be patiently endured if the prospect of cure is assured, but not so if the prospect remains uncertain throughout

For the early accessible growth there is much to be said for vaginal or intrarectal (or perirectal) irradiation without surgical exposure If this fails, surgery can follow without delay Healing is not inhibited after irradiation, provided that the interval between irradiation and operation is not long enough to allow marked fibrosis and consequent diminution of blood supply

It seems impossible to avoid the conclusion that with the experience available the results which may be anticipated are too uncertain to justify preference for radium to surgery *for the operable case* involving the perineal portion of the rectum (exclusive of anal carcinoma) unless surgery is refused or contraindicated on general ground

The operable cases which have been considered so far are the early carcinomas situated below the peritoneal reflection which are easily accessible to interstitial irradiation on the one hand and to local excision on the other

Two other classes of operable growths remain for consideration (1) Those which are above the peritoneal reflection and must, if treated surgically, be submitted either to perineal or to abdomino perineal excision with colostomy, or, if treated with radium, cannot be satisfactorily dealt with except by transperitoneal attack (2) Operable cases of squamous celled carcinoma of the anus

Supraperitoneal Growths

During the past three years I have employed radium (both needles and seeds) by the transperitoneal route (*a*) to barrage the upward line of lymphatic spread along the inferior mesenteric vessels at the same time as colostomy is performed as a preliminary to radical excision, (*b*) to attack the fixed inoperable growth which is situated above the peritoneal reflection, or to deal with the upper part of a growth which lies partly above and partly below

e peritoneum (c) to attack an *operable* growth above e peritoneum in a patient who is considered too old or o unfit to stand an abdomino-perineal excision, and ose growth is too high for perineal excision

From peritoneal irradiation is a far more risky procedure an perineal irradiation Radium causes a variable amount inflammation of the peritoneum often with effusion of uid in the area attacked and if this area is not protected om the small gut and drained there is a risk of paralytic ius and general peritonitis or of adhesions Further if he lumen of the bowel is penetrated by a needle and a rack is established between the lumen and the peritoneal avity as the result of radium necrosis there is a considerable risk of general peritonitis

I experience has shown that the use of radon seeds within he abdomen causes much less disturbance to the peritoneum han radium needles and is a safer procedure but so far the end results have not been so encouraging In my experience this observation applies to most other regions treated with radon The radon seed can be left *in situ* and have not apparently caused any harm The removal of the needles often calls for a second anæsthetic

(*a*) The use of radium within the abdomen as an adjunct to radical surgery seems rational but it is not possible at the present time to assess its value When colostomy is performed as a preliminary to perineal excision the liver, meso-rectum meso-sigmoid and iliac regions are first examined When no gland are detected and the growth is freely movable and obviously an early one radium is not used If glands are palpable radon seed are inserted along the meso-rectum beside the gland If no glands are felt but the growth is more advanced though considered operable—that is a borderline case—the mesentery is barraged Seeds containing 1 millicurie filtered with 0·5 mm of platinum, are usually employed within the peritoneum and are not removed A certain amount of plastic inflammation follows and radium (or radon) should not be used if an abdomino-perineal or an abdominal resection is contemplated afterwards

(*b*) The use of radium within the abdomen to attack a growth in the upper part of the rectum or the lower portion of the sigmoid when the growth is regarded as inoperable is certainly justified if only by one excellent result in which a growth attached to the bladder and fixed to the sacrum was successfully treated with radium needles This patient remains well and free from all symptoms nearly three years after treatment His bowels act normally no growth is visible he has no colostomy Several similar cases have been helped enormously and the lives of these patients undoubtedly prolonged by the use of radium combined with colostomy In some of these cases the growth does not completely retrogress but becomes quiescent and the patient gains in weight improves in general health and is personally much impressed with the benefits received

(*c*) The cases treated by transperitoneal radiation and regarded as operable (*qua* the growth) have been with one exception regarded as too old or too unfit for radical surgery None of these has been under observation long enough or shown sufficient evidence of retrogression to suggest a cure

Squamous-celled Carcinoma of the Anus

This condition stands on a somewhat different footing to adenocarcinoma of the rectum Early cases which have not infiltrated deeply into the ischio-rectal fossa surrounded the anus or invaded the inguinal glands can I think be promised an immediate initial cure with interstitial radiation combined in some instances with surface radiation The question of permanent cure cannot yet be answered So far results in these cases have been excellent with one exception in which recurrence followed an apparent cure This was the first case of the kind treated (1925) Recurrence occurred wide of the original growth and it is probable that the periphery of the growth was inadequately irradiated

There are distinct advantages in the use of radium in these cases over surgical excision Radical removal of an anal growth involves removal of the sphincters and a colostomy, whereas with radium, in most early cases, complete restoration of rectal function can be secured and a colostomy avoided I can state with confidence that a squamous-celled growth involving the anal canal should be treated with radium in preference to surgery, at any rate in the first instance

THE INOPERABLE CASE

Individual standards as to operability vary, so that the borderline case cannot be defined, but there is general agreement in defining the advanced *inoperable* case—the large fixed annular growth which has infiltrated through the rectal wall in all directions

How far can these cases be helped with radium? We all recognize that in the absence of liver metastasis both the general and the local condition of the patient improve in the majority of cases after a colostomy has been performed If colostomy is followed by irradiation it may not always be easy to say whether the improvement is the result of irradiation or colostomy, or both My experience has shown even in cases which have been submitted to colostomy some time previously that rapid and marked general improvement follows irradiation even in the absence of any marked local changes In a small percentage of these cases the growth ceases to be active, and if it has been effectively barraged it is destroyed and transformed into a fibrous stricture In one such case the patient remains well and free from evidence of growth four years after radiation

The outstanding problem is to secure adequate and uniform radiation To effect this a combination of method is often necessary, and frequently more than one treatment is required

At the time of colostomy if the growth extends above the peritoneal reflection it is essential to treat this portion from the abdomen either with radon seed or with radium needles the former I prefer and the latter I think more efficient The meso-rectum is treated at the same time Subsequently if the growth is also infraperitoneal this portion is dealt with in a variety of ways according to the extent and situation of the growth either by posterior barrage, *vaginal irradiation intrarectal seed* or by a combination of the methods, sometimes with the assistance of the intrarectal tube

Very large and advanced growths should not be dealt with by the posterior open operation The risks of perforation and secondary sepsis are considerable and the prospects of cure too remote These cases often get great relief from perirectal and intrarectal attack I have described these methods fully elsewhere

One example of combined treatment may be cited

> A major aged 36 came under observation in October 1928 with a very large annular cauliflower growth which was mainly infraperitoneal and completely filled the rectum It was evident that growth had been very rapid The patient had quickly lost weight and looked very ill Colostomy was performed and abdominal irradiation with needles was applied to the upper portion of the growth three weeks later perirectal radium needles and intrarectal seeds were used the total dose of the combined treatment being 11 000 gold mg hours Ten weeks later the anterior portion of the growth was given another 4 000 mg hours with seeds introduced through the skin
>
> At the present time more than 18 months after treatment the patient is remarkably well having gained several stone in weight The rectum is extensively fibrosed and it is not possible to say if any growth remains

The prognosis of a rapidly growing cauliflower growth in a man of 36 is extremely bad and I am certain that this patient would not be alive and well to-day without radium

Conversion of Inoperable into Operable Growth

In several instances an inoperable case has been treated with radium with such marked improvement that a radical excision has been carried out subsequently I may mention two cases in which a perforation through the posterior vaginal wall was present at the time of irradiation In both cases the perforation healed the growth becoming smaller and less fixed Both patients are in good health after excision and one has survived four years

The Borderline Case

In view of these experiences it would seem that the borderline case—that is, the doubtful case as regards radical operation—provides a useful, perhaps the most useful, field for irradiation A cure may result from irradiation, or the local condition may be so improved that radical surgery becomes possible

Recurrence Following Radiation

In all branches of surgical irradiation it happens, unfortunately, that cases of apparent cure relapse, or that a tumour shrinks to small proportions and then resumes active growth Such results no doubt will become less frequent with increased experience So far as my own experience goes, a recurrence is more likely to follow the use of radon seeds than needles, it is probable that the diminishing intensity of radon, as opposed to the constant intensity of radium, is the causal factor It may be possible to overcome the factor of diminishing intensity by reinforcement—that is, by adding additional radon seeds at short intervals, which can be done in certain situations, especially when general anaesthesia is not required Another method is to combine intrarectal seeds with perirectal needles, a method which minimizes the loss of intensity, though it does not give a uniform intensity In several instances when retrogression of the tumour has appeared to be complete (or nearly so) and recrudescence has followed, irradiation has been repeated (in a few cases more than once), but in most instances the result has not been very satisfactory

Without doubt, primary irradiation increases radioresistance to secondary radiation Relapses following apparent success become more noticeable as the number of cases increases It is evident that if we are to make further advance we must improve technique and explore the possibilities of radium in combination with x rays, lead selenide, etc, more fully

Conclusions

1 In young people, in increasing ratio from the age of 40 downwards, rectal carcinomas grow rapidly, metastasis occurs early, and the end-results of radical surgery are not good An actively growing carcinoma in a young subject responds well to radium, and far better than a slow-growing carcinoma in an elderly subject End-results in comparison with surgery are not available

2 If a growth is adequately barraged with radium and shows little evidence of retrogression after two months, it is probably useless to repeat irradiation On the other hand if the growth responds to radium and readily retrogresses, though it fails to disappear completely, further irradiation is indicated on the ground that the dose has been insufficient in respect of amount, time, or distribution

3 Secondary irradiations are less likely to produce a good final result than an adequate primary irradiation, and are more prone to produce pain of a neuralgic type, which may be very severe and last for long periods

4 When the growth has been exposed by open operation, an overdose may result in perforation of the bowel with secondary sepsis and when healing takes place be followed by excessive fibrosis and consequent stricture

5 The criterion of a correct dose are absence of sepsis, a well-marked radium film, rapid resolution of growth, restoration of normal epithelium, and limited fibrosis

6 Radon is less efficient than radium, but is valuable within the abdomen and within the lumen of the rectum

7 Apart from the possibilities of cure, radium has its value in improving both the local and the general condition of an inoperable case so that in some instances operation with prospect of a cure becomes possible In cases of local recurrence it is an asset of great value especially if the recurrence is treated early It gives hope to those who are beyond surgical help and in moderate doses has a remarkable tonic effect on the general health

8 For epithelioma of the anus radium is in all probability more efficient than surgery

9 The treatment of cancer of the rectum with radium is still in the nursery stage Time will show whether selection, combined with increased experience and skill [illegible] vastly improve results in radium therapy, or will reveal that radium is too capricious a master and too [illegible] servant to be reckoned with as a serious fighting factor in the campaign against cancer

Research on radio-resistance and methods of sensitization is an urgent need It is not enough to say "Here is a cancer of the rectum, let us excise it or let us treat it radium" We must have an index of sensitivity and a corresponding dose index, and we must develop a technique that allows no uncertainty in the application of the [illegible] cated dose For help on these lines we must look to the physicist, the biochemist, and the pathologist

When we consider how long it has taken to develop the high technical standard which now exists in abdominal surgery—so high that Lord Moynihan has said we ought not to hardly hope to advance it much further—we ought not to be downhearted Medicine in recent years has advanced by leaps and bounds because the biochemist has come to the aid of the physician Is it too much to hope that the "big five"—medicine, surgery, pathology, biochemistry, and physics—will by team work enable the radium worker to conduct his practice on a strictly scientific basis rather than empirically?

We must not be blind to the fact, however, that radium is no panacea for cancer It has very definite limitations, which need emphasizing We know that brilliant results can be secured with radium in a small percentage of cases Can we doubt that further research, increased experience, better technique, and greater skill will reduce the failures and add to the successes?

RADIUM AND SURGERY IN CANCER OF THE TONGUE*

BY

DOUGLAS QUICK, M B, F A C S,

ATTENDING SURGEON, MEMORIAL HOSPITAL, NEW YORK

Cancer of the tongue embraces one of the largest groups of epidermoid carcinoma For the purpose of discussing this common form of tumour process it may well be taken as illustrative of practically all types

Anatomically, growths of the tongue range from the most superficial papillary outgrowing processes to the deeply infiltrating neoplasm, with little by way of surface manifestation to call attention to it before it is entirely out of bounds Depending upon the location, it may be most accessible or it may be practically impossible of technical approach When cancer is superimposed upon chronic inflammatory processes, notably leucoplakia, luetic glossitis, or both, the anatomical changes may be such as to alter the normal course and type of growth and to present added complications from the therapeutic standpoint as well

Practically every histological type of epidermoid carcinoma is encountered in the tongue, from the papillary squamous-cell growth to the invasive infiltrating tumour of like cellular structure, and from the fully differentiated adult type to the totally anaplastic transitional cell structure Tongue cancer is influenced by all of the various factors of dental and oral hygiene The chronic irritation of irregular teeth or dentures is a well recognized contributory cause in the development of lingual growths The bacterial flora of the ill-kept mouth exerts a profound influence on the otherwise normal course of a growth, if, indeed, it does not actually contribute towards its development

There is a consensus of opinion that tongue cancer [illegible] affords an average cross-section of therapeutic results in comparison with intra-oral cancer in general It is the purpose of this communication to emphasize particularly two points (1) the combined use of radiation and operative surgery offers several advantages in the treatment of

* Read in the Section of Surgery at the Annual Meeting of the British Medical Association, Winnipeg, 1930

rmoid carcinoma in general, (2) the treatment of epi loid carcinoma is steadily approaching a more reason- accurate, and efficient basis

t this stage in the development of radiation therapy is but natural to expect that many conservative eons and some sceptics, will have none of it At the er end of the scale are the extreme radiation therapists, er to cure all cancer by irradiation Radiation therapy established a place for itself beyond question How- r it has never been considered the ideal specific cure all cancer The surgical efforts towards the relief of ncer have fallen short yet they have not been futile by y means It is unfortunate that more attention has t been directed towards combining the best from each ethod for the ultimate good of the cancer sufferer

Histological study of the relative degrees of cellular ifferentiation or potential malignancy of tumour processes as been most enlightening from the therapeutic stand- oint It shows very clearly the chief reason for surgical ailure in many instances and at the same time explains ome of the most spectacular reactions to irradiation The undifferentiated growth highly malignant, prone to early and widespread dissemination through both lymphatics and blood stream is obviously a poor surgical risk On the other hand it is highly radio-sensitive The fully differ- entiated tumour process is more orderly in its development Metastasis occurs as a rule later in the course of the disease and even then tends to remain within a limited area In such cases it is but reasonable to expect relatively better results from operative measures The more adult the growth the more radio-resistant it becomes The reaction to irradiation is not nearly so spectacular and yet if the process be controlled by this means the assur- *ance of permanency of the result is much greater*

The application of these observations on relative radio- sensitivity based on the degree of cellular differentiation of the tumour process is of tremendous practical impor- tance It not only aids in determining the treatment method of choice but if that method be irradiation, it serves as a guide to the necessary intensity of dosage

The work of Martin and Quimby at the Memorial Hospital, on the estimation of relative dosage intensities for different types of epidermoid carcinoma gives a practical basis for dosage estimations They have shown that adult epidermoid carcinoma requires from seven to ten skin erythema doses throughout the tumour-bearing area to produce complete and permanent control of growth The anaplastic growths on the other hand respond completely to a dosage range of three or slightly under to five or six skin erythemas depending upon the relative degree of differentiation

The dosage intensity judged necessary in a given case governs in turn the technical methods employed to pro- vide that dosage The most that can be delivered by external irradiation—radium *x* rays or both—to the mid *line of the oral cavity within a treatment interval of* two to four weeks and consistent with safety on the part of the patient is two and a half to three skin erythema doses External irradiation, therefore, is capable of causing com- plete regression of only the most radio-sensitive growths of the tongue Growths showing any degree of cellular differentiation must have their irradiation intensity in- creased by some means in addition to the maximum of external irradiation Interstitial irradiation must be employed Epidermoid carcinoma lends itself more readily to histological 'grading' than some other types of malignant processes The distinctions are more clear-cut and better defined This together with the fact that the initial dosage intensity studies were carried out in the same group places epidermoid cancer therapy in the forefront at least from the standpoint of accuracy

The problem of tongue cancer which was regarded a few years ago as very fully understood clinically and patholo- gically and dependent for cure on improved technical operative measures, now stands in an entirely different light The relative radio-sensitivity is the guide to selection of the treatment procedures as well as to the prognosis Irradiation is assuming a degree of accuracy and exactness comparable to a nicely adjusted surgical procedure rather than following on in the empiric channels of the earlier radiation therapy

In short the treatment of tongue cancer is not a matter of following a standard technical procedure adopted as a group problem It is a special problem in each individual case, one following certain broad principles but in detail guided by the steadily increasing fund of new information now coming to us

Inasmuch as treatment detail is based largely on histo- logy of growth it is essential that a biopsy be done early and in all cases The theoretical objections to this pro- *cedure are overridden by the advantages of the informa-* tion obtained If done with care, the trauma is negligible A small piece of tissue a few millimetres in diameter, if carefully selected and removed without tearing or crushing is sufficient A clinically cured case is of no value, except to the one who has treated it, unless substantiated by a positive section The Wassermann reaction is of interest and of some practical value Cancer in the presence of a positive blood complement fixation, reacts better if moderate antiluetic treatment is employed All too fre- quently however the matter of diagnosis is closed with the positive Wassermann reaction and cancer is ignored until it is beyond control Altogether the Wassermann reaction has been more of a curse than a benefit to cancer therapy

Before any aggressive treatment is undertaken in tongue cancer rigid oral hygienic measures should be constituted Local sepsis not only depletes the patient's general con- dition and contributes to local necrosis, but it nullifies to a great extent the normal reaction to irradiation In fact irradiation in the presence of any marked degree of local mixed infection is of questionable value Infected and *jagged teeth should be removed unless encroached upon* very closely by active tumour tissue Cleansing methods should be aggressive and efficient, but irritating solutions should be carefully avoided

The last published report on tongue cancer from the head and neck department of the Memorial Hospital was presented to the First International Congress of Radiology in London in 1925 and was published in the *British Journal of Radiology* in March 1925 Since that time we have adhered to the same *principle of treatment* as outlined in that report with the various improvements incidental to further experience additional technical facility and more efficient equipment

Radium emanation or radon in gold capillary seeds with a filtration of 0·3 mm gold has been used for inter- stitial implantation since early in 1925 External irradia- tion of greater intensity than formerly employed is being used as a routine in all cases For the past three and a half years our equipment for external irradiation has been augmented by a four-gram radium element pack The combination of treatment measures is coming more and more to be guided by the histological interpretation of the tumour Dosage intensity is better understood and has been made applicable practically to the routine work The indications for neck dissection are gradually being limited, so that dissection is restricted to a relatively smaller group of cases Most gratifying of all is the steady increase in co-operation and contact between pathologist physicist and clinician The complexities of the problem demand the concerted efforts of a group of workers

In the treatment of cancer of the tongue we depend upon irradiation entirely for direct complete control—or growth restraint only if palliation is aimed at—of tumour tissue in all circumstances except in the operable meta- static cervical nodes of fully differentiated carcinoma In these removal by complete surgical dissection is further restricted if the primary growth is not controlled or if the metastatic involvement is bilateral

All cases accepted for treatment receive as an initial procedure, external irradiation of maximum intensity during the first two weeks This is directed through both sides of the neck and includes within the field of irradia- tion the site of primary growth as well Immediately following this, gold seeds of radon—individual value about 2 millicuries each—are inserted into the base of and round about the primary growth The dose is determined on the

basis of radio-sensitivity of the growth and the established dosage intensity experience previously referred to It is regarded as safer to withhold the implantation until the external irradiation has been completed, or nearly so The growth is smaller and better defined

Necrosis of tissue rarely occurs, except in the presence of uncontrolled local infection If the growth be bulky, fungating, and markedly infected, the implantation of radon is followed in a few days by cautery removal of the condemned area By utilizing the tumour bed as a radium holder the entire tumour bed is heavily and uniformly irradiated It is therefore a safer subsequent operative field By increasing the total strength of implanted radon to compensate for the subsequent sacrifice of the unused portion, the surgical removal may be done before all of the emanation is exhausted It is sometimes simpler to do it this way before the anatomical limits have been obscured by radium inflammation The area removed is only that which might otherwise break down It is not extended to a wide surgical removal, since responsibility for direct control of growth has been placed with the radium The removal is to promote surgical cleanliness only Pain is thus relieved, more rapid healing encouraged, and a minimum of deformity produced

Secondary invasion of bone by growth, infection in bone, or devitalized bone caused by irradiation calls for surgical removal At times the after-care of tumours at the base of the tongue may be facilitated by removal of a segment adjacent to the lower pole of the tonsil, and, of course, after the irradiation has been completed

New growths at the base of the tongue are deserving of special mention The hopelessness of dealing with these surgically has always been considered due to technical difficulties Study of them histology would indicate that it has been due largely to their lack of differentiation Practically all of the anaplastic tongue growths have their origin in or closely associated with the area of the lingual tonsil The transitional cell carcinoma was first recognized from this location Like all growths arising in intimate association with the lymphoid tissue of the pharyngeal ring, they exhibit a degree of radio-sensitivity almost out of keeping even with their degree of histological cellular differentiation This explains the occasional complete regression of type of growth under the influence of external irradiation What has always been regarded as a particularly hopeless only The relative curability of lingual cancer in the other locations—tip, dorsum, and lateral border—is very largely dependent on the anatomical character of the growth together with the ease of difficulty of technical access

Carcinoma developing in a tongue which is the seat of a generalized luetic glossitis follows a course clinically different from the same histological type under normal conditions of tumour bed The rate of growth is slow, it is particularly radio-resistant the tendency is towards multiple lesions probably because the site predisposes to multicentric involvement Because of the limited blood supply and the increased fibrosis secondary necrosis under heavy irradiation is common It frequently calls for a limited surgical removal following interstitial irradiation When it becomes necessary to remove tissue from the tongue as just outlined an ordinary electro-thermic cautery—heavily constructed so that it will maintain a uniform degree of heat without intermittent cooling, and with a flat blade which permits of excising the condemned area of tissue rather than simply burning it out—is employed

We have gone through the experiences with the various equipments for coagulation of tissues by means of currents of a high rate of oscillation These procedures take their place in the cautery field and whether they or the old-fashioned cautery methods are employed is a matter of personal preference The very admirable article by Mr W Douglas Harmer on the use of the high-frequency cautery in the issue of the *British Journal of Surgery* for April 1928 is a most reasonable presentation of this method It is doubtful however if it quite fulfils all that can be accomplished at present in the treatment of mouth cancer and it is possible that the psychological appeal of such equipment, in some quarters at least, may obscure certain fundamental principles of cancer th[illegible] which to-day are fairly well recognized

TREATMENT OF THE NECK

The treatment of metastasis in the cervical lymph n[illegible] is probably of greater importance than that of the pri[illegible] growth Our method of dealing with the neck is based on the premise that the cervical lymph nodes perform a d[illegible] servative function, up to a certain point at least T[illegible] protective reactions within the lymph nodes as obs[illegible] histologically are well known, and further obs[illegible] on irradiated normal lymph nodes strongly suggest th[illegible] this reaction is amplified under the stimulus of radiat[illegible] Whatever may be said of the various glandular type[illegible] cancer, it is fairly well established that metastatic ext[illegible] sion of epidermoid carcinoma is by embolism

When a metastatic deposit makes itself evident it [illegible] usually in one lymph node only, or at most confined t[illegible] one or two adjacent nodes Widespread involvement [illegible] multiple nodes involved rarely occurs until very late [illegible] the course of the disease We believe that in the ear[illegible] stages, with a single palpably enlarged node, the cap[illegible] of which is intact, the disease can be dealt with quite as efficiently as is possible by doing a dissection before the node becomes palpable In other words, routine block dissection of the neck is not practised

All necks are treated by means of heavily filtered external radiation of maximum intensity consistent with tissue tolerance and from both sides, as previously mentioned in discussing the primary lesion For economic reasons heavily filtered high-voltage *x* radiation is used [illegible] preference By preference heavily filtered radium would be used Clinical observations suggest that radium is preferable to *x*-radiation It is only since having at our disposal a four-gram radium element pack, however that it has been possible to carry out this type of radium radiation with maximum efficiency, and that only in the more favourable cases Unless the actual quantity of radium utilized in this manner is equivalent to the quantity of *x*-radiation, then it is preferable to use *x* radiation A good dose of *x* rays is always better than a poor dose of radium

For some time clinical observations seemed to indicate that *x*-radiation and heavily filtered radium could be combined for the neck irradiation to advantage in two ways It was noted that the total quantity of radiation which the skin would tolerate was greater by combining the two than when a comparable quantity of either agent alone was used The reaction within the tumour-bearing area as observed clinically was superior Observations by Dr Ewing on histological preparations of tissues so irradiated have led him to conclude that the effect of *x*-radiation is more pronounced on the connective tissue element, while radium is more effective on the cellular structure

Experiments by Quimby and Pack in the Memorial Hospital biophysical laboratories have confirmed the clinical observations on the skin tolerance There is a difference, dependent apparently on the differences in wave length, which permit of increasing the total quantity of radiation by combining the two ranges of wave-length Patients presenting no palpably enlarged metastatic nodes on admission for treatment are subjected to heavy external irradiation and kept under routine observation If a palpable node of adult type epidermoid carcinoma is present, complete unilateral neck dissection is done under local anæsthesia All the lymph-node-bearing areas from the chin to the collar-bone, and including the submaxillary salivary gland, the jugular vein, and the sterno-mastoid muscle, are removed through a modified Bastianelli incision Before the wound is closed filtered radon seeds are implanted at any suspicious points within the wound, particularly where the lymphatic paths are severed This does not interfere appreciably with the healing of the wound No post-operative irradiation is employed

If the metastatic lymph node be inoperable no attempt is made toward local removal or complete dissection The surgical exposure is utilized to implant filtered radon seeds throughout the tumour-bearing area, and the wound is then closed This procedure, with a minimum of trauma to the blood supply of the local area, is preferred to a partial

moval plus radium for the remainder Any node in ich the disease has perforated the capsule is regarded as ng inoperable even though it may be small and, from standpoint of technique, removable in the gross ether with the adjacent structures All necks with steral metastatic nodes are regarded as being surgically operable even though they may be quite readily remov- le technically Once the disease has involved both sides the neck it is considered as incurable by many means cept in very rare instances For the very advanced tastatic nodes external irradiation only, as a palliative asure, is used

Complete and permanent regression of fully differentiated anmous-cell carcinoma secondary in the nodes, has not en observed from external irradiation alone Metastatic des from anaplastic epidermoid carcinoma even though main within the definition of an operable node are ated by radium alone Usually, filtered radon tubes e implanted as well, just as in the treatment of the imary growth in this group, but the backbone of treat- ent in this type of le ion is external irradiation, and no sort is made to operative surgery for removal The outine external irradiation of the neck is done within a eriod of a fortnight

Unfortunately from the standpoint of statistics we ontinue to treat practically all cases applying at the linic There is no selection, except to decline acceptance f those equal to nursing care only From a humane tandpoint it has been necessary to do this, and, on the ther hand it has always been the feeling that observa ion of all stages of the disease is of value Such a policy, owever precludes a satisfactory comparison of statistics ith radiological clinics where selection is practised, or ith surgical clinics where none but operative methods are mployed

Our reports on tongue cancer, made at the Second Inter national Congre of Radiology in Stockholm in July, 1928, overed a group of 473 histologically verified and clinically *unselected* cases treated during the period from January st 1917 to December 31st 1927 The survivors in this roup have been rechecked to December 31st 1929

The percentages of freedom from clinical evidence of disease are as follows

	Cases	Percentage.
Tip of tongue	6	40
Dorsum of tongue ..	10	17
Lateral border of tongue	54	19
Base of tongue ..	13	11
Recurrent	4	17

Of the total group 97 or 20 per cent , are alive and living active lives Of these 87 or 18 per cent , present no clinical evidence of disease

The intervals of freedom from disease are as follows 39 case five to twelve years 24 cases, three to five years, 24 cases two to three years

Of the entire group 69 per cent are known to be dead A number of these patients died of intercurrent disease and while free from clinical evidence of cancer, 19 lived five years or over 19 lived three to five years, 113 lived one to three years while 179 died within one year

In the group showing no evidence of metastatic involvement of nodes throughout—189 patients—66 have now no evidence of disease The group of 161 patients with gross evidence of lymph node involvement on admission shows only 6 no evidence of disease now and of the 103 developing nodes after admission, 12 only have now no evidence of disease

It is true that all these patients did not die as a result of the metastatic involvement Many were far advanced in the primary site In many others the node involvement was hopelessly advanced The group does not include an appreciable number of our gold tube radon implantation cases The failure to control these cases with metastatic cervical nodes however leaves much to be desired in the treatment of the neck

In the entire group of 473 cases the percentages of surgical operability on admission were as follows

	Percentage
Tip of tongue	60
Dorsum of tongue	25
Lateral border of tongue	46
Base of tongue ..	9

The percentage of freedom from clinical evidence of disease in the entire group of unselected cases—18 per cent —is regarded as comparing favourably with the average of operative surgical statistics in the group of operable cases alone

Summary

1 At the Memorial Hospital radium is the agent of choice for treatment of the primary growth in cancer of the tongue

2 X-radiation is a necessary complement to the treatment of all cases of lingual cancer unless replaced by the use of very large amounts of radon for external application

3 Radium must not be depended upon entirely and in all cases, to the exclusion of other associated measures

4 Operative surgery is indicated in the mouth for access, drainage and in dealing with disease in bone

5 Operative surgery is indicated in the neck in early definite involvement of adult epidermoid carcinoma, in addition to irradiation

6 Surgical exposure in the neck, plus filtered radon implantation, is indicated in a variety of metastatic conditions other than the group operable by complete dissection

7 The election of technical methods and the guide to irradiation intensity is through an appraisal of the relative radio-sensitivity of the growth as judged by the degree of cellular histological differentiation

8 The irradiation must be directed with care and precision The minimum intensity must conform to well-defined standards

9 The best interests of the patient are served through close co-operation between pathologist, physicist, and clinician

RADIUM TREATMENT OF BUCCAL CARCINOMA.

PRINCIPLES AND SOME RESULTS *

BY

C F BIRKETT, *M.C.*, M.R.C.S.,

HONORARY RADIOLOGIST MANCHESTER AND DISTRICT RADIUM INSTITUTE AND CHRISTIE HOSPITAL FOR CANCER

REVOLUTIONS in medicine and surgery as in anything that matters are rarely successful, but it would appear that the treatment of carcinoma of the mouth and tongue is an exception to the general rule and that it is extremely improbable that we shall ever revert to the older forms of treatment, at any rate for the primary growth This surgical revolution, however, is more apparent than real, and takes no account of the painstaking work of the last two decades in radium therapy It was Dominici—whose death was probably due to excessive exposure to the gamma rays—who drew attention to the importance of filtration in eliminating the direct action of the beta ray and so utilizing the selective action of the gamma ray Later, Regaud showed that the prolonged action of the gamma rays in relatively weak intensities produced in the squamous epithelioma at any rate, a more favourable response than a high intensity for a short time

During the war small unscreened glass emanation tubes 5 to 10 millimetres in length and containing 1 to 2 millicuries of emanation, were used extensively in America for buccal carcinoma These were buried and left permanently in the tissues A very intense local reaction followed owing to the unrestricted action of the beta rays but results were good in such patients as survived the ordeal with its distressing and painful complications It is important to realize that this method embodied the principle of prolonged irradiation of which Regaud is an advocate Later Failla at the Memorial Hospital New York used gold seeds 0 3 mm in wall thickness filled with emanation, which cut off about 50 per cent of the beta ray while

* A communication to the Section of Surgery at the Annual Meeting of the British Medical Association Winnipeg 1930.

still later, Mun invented the removable platinum radon seed We had used the unscreened seed in Manchester, and an analysis of our cases—when I took over the work from Dr Arthur Burrows in 1925—revealed that 80 per cent of our successes with the primary growth had followed this method of treatment As a result, we began to employ the same method of treatment as Regard for the primary growth, screening our source with a minimum of 0 5 mm of platinum, and using as great an active length as possible

Radium has improved out of all recognition the outlook in buccal carcinoma, and it has, I think at the same time enriched our knowledge of the disease The original surgical conception of the disease required the removal of the primary growth, the lymphatic tract to the lymph nodes, and the nodes themselves *en bloc* The operation thus resembled in conception and execution the radical amputation of the breast as it is still performed, but involved a much higher mortality It was realized, however, even before radium was seriously considered as a factor in treatment, that cases could be cured by the ablation on separate occasions of the primary growth and the lymph nodes, and radium treatment has conclusively proved that, in buccal carcinoma, metastasis to the lymphatic glands is by embolism

But radium has done more than this, for the coincident investigations of the histological structure of buccal carcinoma in different parts of the mouth have shown that quite well-marked variations occur with corresponding variation in sensitivity We know now that almost every carcinoma of the base of the tongue will be of an embryonic, undifferentiated, and radio-sensitive type, that consequently there is a good chance of local cure in almost every case, and that the danger lies in the rapid and widespread metastasis The only cases I have seen of pulmonary metastases in buccal carcinoma have been of this type We know that epithelioma of the cheek, lip, floor of the mouth, and anterior third of the tongue are almost invariably of a highly differentiated type, with abundant cell nests They are radio-sensitive, but less markedly so than the preceding type Our own observations indicate that practically every case in which the anterior third of the dorsum is affected the condition is superimposed upon a chronic glossitis of syphilitic origin This interferes with the response to irradiation, and, occasionally, even small lesions do not respond In such cases it is always advisable to point out that diathermy may have to be used later if radium is unsuccessful Such cases strengthen the evidence that tissue reaction is an important factor in the effect produced by radium on malignant tumours

In the middle third of the tongue on the tonsil and fauces and soft palate, both histological types and also intermediate varieties are found

It would seem from the above considerations that all squamous epitheliomata of the mouth and tongue are radio-sensitive some more so than others, and that there is now unanimity of opinion that prolonged irradiation with gamma rays of low intensity yields the best results The problem, then should be mainly one of the insertion or application of the radium

Seeds or Needles

It has always seemed to me that it is infinitely easier to insert a needle of active length, say, 30 mm, than six separate seeds of active length 5 mm, and it becomes the more evident the larger the growth This is a general opinion in England, where we use needles of active length up to 50 mm for the treatment of breast carcinoma I would say unhesitatingly that needles are superior to seeds There occur some occasional complications from radium treatment which certainly do not follow operative methods, involving necrosis of bone or of the soft tissues If a lesion involves bone superficially necrosis is almost inevitable if the disease is to be eradicated, and may be prolonged and distressing If bone is extensively involved it is doubtful whether the disease will ever be eradicated by radium alone, and in such cases radium treatment of the soft parts combined with surgical excision of the affected bone, if possible, is the better procedure

No matter how careful and experienced the operator may be, necrosis of the soft tissues sometimes follows Over-treatment rather than under-treatment should always be our aim, since a second application does not produce so active a response as the first, except after a long interval of time, when it is probably too late

In the preceding remarks it has been assumed that the primary growth is treated first The primary growth must be regarded as a source of embolic infection of the glands, and clinically we know that if the lymphatic flow is blocked by extirpation of the glands on one side of the neck, it is diverted to the opposite side I have seen several cases which demonstrate this Radium treatment is a conservative method which, if successful, restores function almost to normal, little need be said as to its advantages over surgery of the tongue In the cheek, palate, and floor of the mouth little can be seen except slight scarring in the tongue the same may be said, although slight deviation to the affected side with pointing of the tongue to the opposite side is noted in lesions of the middle third Speaking, eating, and drinking suffer no impairment Local recurrence is rare after six months, and cases of so-called "recurrence" are those in which the growth has never really disappeared

The Lymphatic Drainage Area

Although most workers are agreed as to the principle of treatment of the primary growth by radium, there is no method of using radium alone which has established itself as the method of choice in the treatment of the lymphatic drainage area Even with a primary growth confined to one side of the mouth we have to consider the treatment of a wide area bounded in practice by the limits of the anterior and posterior triangles of the neck on the same side, although theoretically, and occasionally in practice, metastases occur in the opposite anterior triangle Needling is a localized method of treatment, and if in the primary growth which is relatively circumscribed, we are compelled to insert some fifteen needles, we ought to implant at least thirty to forty in the much wider secondary area In the majority of cases of buccal carcinoma the upper deep cervical and later the lower deep cervical, groups of glands are invaded and some of these lie posteriorly to the internal jugular vein These cannot possibly be dealt with adequately by the insertion of radium needles blindly through the skin and a thorough exposure of the neck is necessary Similarly, in order to deal effectively with the glands in the posterior triangle and supraclavicular fossa, the sterno-mastoid muscle should be divided and reflected upward I think, therefore, that if all this is necessary for adequate treatment by the implantation of needles, a block dissection might as well be done at the same time, in an operable case With an experienced operator and a regular assistant the operation is not so formidable as it appears and I am convinced that it is one of the best surgical operations in malignant disease The tragedy is that so many block dissections are so only in name

In an operable case the choice rests between the implantation of needles and some form of external irradiation. It is very doubtful if external irradiation, except in the case of the radio-sensitive types which are found at the base of the tongue, has ever cured a case with fixed secondary deposits in the neck Our practice in Manchester is to reflect flaps, as in the case of a block dissection of the neck, and divide the sterno-mastoid Needles are then inserted in the anterior and posterior triangles about 2 cm apart They vary according to circumstances in active length between 20 and 50 mm, and are left in position about eight days Usually thirty to forty needles are required, and the wound has to be reopened under a general anæsthetic for their removal One should never subordinate the position and direction of the needles to ease of removal

There is justification, in my experience, for the adoption of a policy of observation if no glands are palpable, provided the patients are seen at least once a month If means had permitted, these patients would have been subjected to external irradiation by about half a gram of radium at 4 to 7 cm distance At the Fondation Curie a routine block dissection is performed, followed by deep irradiation if microscopical deposits are found in the

nd removed Our own position may be summarized follow

1 If no glands are palpable observation at monthly erval

2 If gland are palpable and removable block dissection her combined with implantation of radium or followed external distance irradiation

3 If the glands are fixed implantation of a large mber of needles, thirty to forty, after thorough exposure the neck

The Results of Treatment

There are very few figures available for the results of eatment by radium alone

Berven of Stockholm published in 1928 the results in patients of whom 13 were alive five years later (59 per nt) These however, were "operable' cases, and dium was not the only factor concerned His practice to use diathermy, either for excision or coagulation, and supplement this with the implantation of radium for venty four hours I do not think that the results should included or compared with those obtained by radium one Any surgeon of experience will recognize that it is npossible to deal adequately by diathermy with any owth of the tongue which involves extensively the middle r posterior third We all recognize that surgery can have good results with early growths of the anterior ird of the tongue but having seen what radium can complish at all stage of the disease by the technique rt advocated by Regaud with no mutilation and a mplete restoration of function we feel that it has established itself as the method of choice in the first instance

Regaud's last published results were ascertained in December 1927 and I have abstracted and summarized them in he following table

	1922	1923	1924	1925	1926
Total ...	33	54	55	69	54
Complete cure ...	6	10	11	17	21
Percentage ...	18 18	18 50	0 00	23 33	38 88

This table therefore gives results at one two three four and five years respectively It will be observed that if a patient survives for three years he has an almost equal chance of living for two more years

The methods we employ in Manchester which are based on those of Regaud were begun late in 1925 and so far the results have been reviewed only on a three year basis They are as follows

	1925	1927	1928
Total	89	71	113
Complete cure ...	18	27	51
Percentage	42 50	47	45 13

For the same periods of time they are approximately the same as Regaud's, but there are several points to which I should like to draw attention It has been our custom at the Manchester and District Radium Institute to issue an annual report, and this is in effect an annual process of examination Although we cannot claim as cures patients treated so recently as three months previously yet by comparison with the same results year by year we discover whether our immediate results are on the upgrade For the primary site in buccal carcinoma our percentages of "apparent cure" for 1926 1927, and 1928 were 38 7, 47 3 and 60 respectively and, where the primary and secondary sites were considered 27 5 35 and 45 per cent respectively In other words our immediate results improved each year Naturally this percentage became lower when the results were reviewed at a later date, although we do not find that recurrences at the primary site are common I think that this improvement is due chiefly to increased personal experience and that it is an argument for the treatment of carcinoma of the buccal cavity at centres where special experience exists Lane Claypon (Reports on Public Health and Medical Subjects, No 59) has reviewed the statistical literature She concludes "It is probably fair to say that some 25 per cent of patients operated upon will be alive and well three years after operation and 20 per cent at five years"

Although the number of cases treated by radium is relatively small the three- and five year results are about the same as those obtained by surgery But the likeness ends there for the results by radium have been achieved not only in operable, but also in inoperable cases, and with no mutilation to the patient and no impairment of function We all appreciate the art of surgery, but the selective action of the gamma ray in certain types of malignant disease and, in particular epidermoid carcinoma of the mouth and tongue with complete restoration of function must be placed on a higher plane if degree is there be The question naturally arises whether we can confidently look forward to improvement in results I think we can if the following points are considered

Early diagnosis is essential, the more so because involvement of lymphatic nodes is early and increases the gravity of the prognosis With the education of the general public particularly with regard to oral hygiene, I think that as the present generation reaches middle and old age the incidence of oral carcinoma will diminish, and that they will seek advice and treatment at an earlier stage when abnormalities exist At the present time in the hospital class of patient, one feels that if the patient will tolerate for many years as he undoubtedly does a mouth filled with carious teeth of all shapes and sizes, the presence of an early carcinoma is an unnoticed incident in his daily life Commonly such a patient with an immobile tongue will give a three weeks' history only!

Secondly I believe in the concentration of radium treatment at large centres I know from my own personal experience that results with the same radiological technique improve with experience, and that only from the follow up of large number of cases can faults be corrected The same remarks I think apply equally to the performance of a block dissection which at present is often an integral part of the treatment of a case of buccal carcinoma Unless the surgeon has opportunities for the frequent performance of this operation I think the results will be poor One must always remember that Nature does not help us a great deal so far as we know in malignant disease whereas in the inflammatory diseases she plays a big part

TREATMENT OF BLADDER TUMOURS BY RADON*

BY

FRANK KIDD MChir FRCS

CONSULTING SURGEON TO ST PAUL'S HOSPITAL LONDON

Attempts to evaluate the application of radium to bladder tumours are beset with difficulty For the purposes of this discussion I will limit myself to an analysis of the case records of thirty two patients who consulted me for malignant bladder tumours from 1922 to 1930 who were treated by radon and in whose records the complete results are shown Diathermy was always employed as a preliminary to prepare the tumour for the seeds Bare glass seed were used from 1922 until July 1926 Since July 1925 glass seeds screened with 0 3 mm of platinum were employed For a knowledge of both these methods I am indebted to the Radium Corporation of New York and to a study of the work of Keyes Barringer and Muir All the tumours treated were clinically malignant though the majority were small and of recent origin Pathological evidence of malignancy continues to prove unsatisfactory In a number of the cases described below the tumour removed were said by the pathologist to be innocent yet the patients died of secondary deposits within a short time The case were selected for radon treatment mainly for four reasons

1 Because the patient refused extensive operation or would only consent to cystoscopic treatment

2 Because the tumours were in a position badly situated for

* A communication to the Section of Surgery of the Annual Meeting of the British Medical Association Winnipeg 1930

partial cystectomy—that is to say, they lay between the ureter and the internal meatus

3 Because in the case of pedicled malignant tumours it was hoped that radon would shorten diathermy treatment and make it more secure

4 Because in the case of some of the sessile tumours it was hoped that cystotomy and radon implantation might prove less difficult and dangerous than partial cystectomy

TECHNIQUE EMPLOYED

1 In early favourable cases of pedicled tumour or small early malignant ulcer, particularly in women, I was able to destroy the body and pedicle, or the floor of the tumour, at one sitting under general anaesthesia To effect this I made use of a special cystoscope which I devised and have described elsewhere[1] (see Fig 1) (This cystoscope

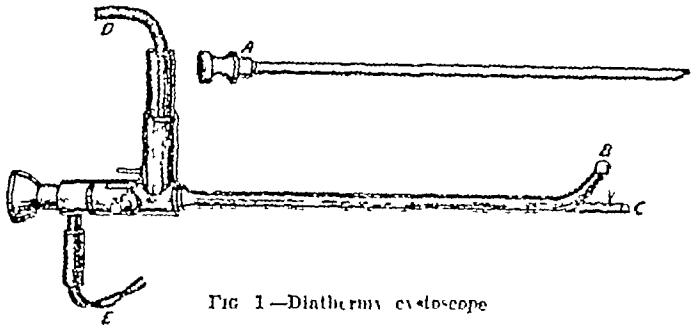

FIG 1—Diathermy cystoscope

has been copied by instrument makers in other countries, sometimes without any acknowledgement) After such treatment a whitened charred ulcer was left, occupying the site of the tumour Around this ulcer at appropriate intervals were implanted through a cystoscopic implanter an appropriate number of radon glass seeds, bare until

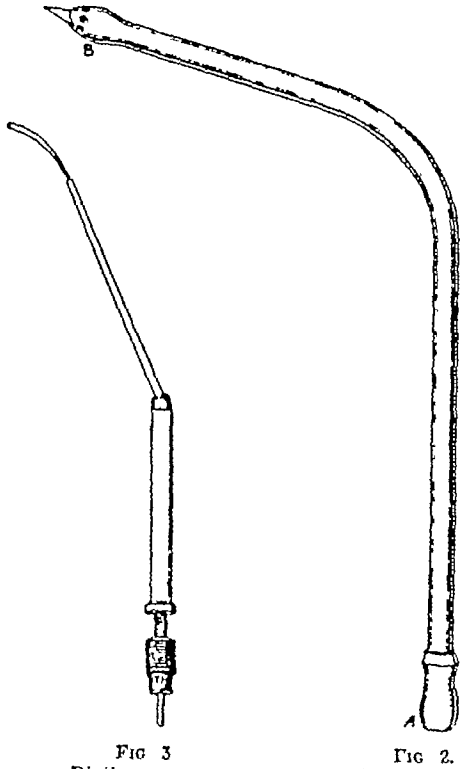

FIG 3
Diathermy snare.

FIG 2.
Suction knife

July, 1926, after that date screened with 0 3 mm of platinum, and containing from 1 5 to 2 5 millicuries of radon These were usually left in position indefinitely, and appeared to give rise to no subsequent trouble The ulcer would take from six weeks to three months to heal up soundly, but it seemed to heal up with less tendency to severe sepsis in a closed bladder than in an open bladder Urinary antiseptics were exhibited by the mouth during this period

2 In more advanced cases with a large, broad-pedicled tumour, and in men rather than in women, the bladder was exposed suprapubically and emptied with a suction knife of my own design (Fig 2) The opening was enlarged to admit a large-bore porcelain cystoscope open end of which the tumour would slip readily thereby cut off from the rest of the wound A diathermy snare (Fig 3) was then introduced pedicle, drawn sufficiently tight, and a full current turned on The pedicle was burnt through the top of the tumour at once withdrawn, caught neatly in the snare A charred ulcer was left at of the pedicle With a gloved finger in the or vagina, to guard these from damage, the ulcer received a further dose of diathermy with a flat electrode Finally, the circumference of the ulcer implanted with threaded screened radon seeds, containing 1 5 to 2 5 millicuries The seeds were 2 cm apart, and one seed was used for each centimetre of growth To estimate both these measurements I used a metal gauge (Fig 4) One end metal rod 2 cm long, the other end has a metal 1 cm in size In such cases there was no need exceed the maximum dose of safety—namely, 2,400 curie hours The gloved finger in the rectum or was kept in place during the implantation of the to assist in guarding those structures and in estimating size of the root of the tumour The bladder was

FIG 4—Radon gauge

up round a large tube The seeds were removed end of ten days Healing was slow, and the wound to be kept open for some time to permit the extrusion sloughs *

3 In more extensive cases of sessile malignant the bladder was opened widely, the surface of the thoroughly cooked with a large flat button diathermy trode, and the edges of the tumour surrounded with of threaded radon seeds at appropriate intervals

RESULTS

Group 1—Pedicled Malignant Tumours

These have thick pedicles, are tough, bald, and fimbriated, they are often covered with fibrinous plu and may be associated with mild cystitis Careful or vaginal examination under anaesthesia may reveal indefinite small area of thickening in the base of pedicle, but this is not found in the majority of cases

Thirteen such cases were treated from August, 192 March, 1930—six males and seven females

Of eight patients treated cystoscopically, two died of rapid recurrences probably induced by radon of bronchitis Both patients were over 80 years of Radon appeared to irritate, and probably accelerated d in both these cases Five patients are alive and without recurrence, in one case seven years, in anot six, and in three cases two years have elapsed since t treatment, but in four of these the radon did not c complete disappearance of the growth, so that they had have further treatment by diathermy, which was success The doses varied from 133 to 999 millicurie hours, th was little trouble with sloughs, apart from a tempor cystitis lasting four to six weeks One woman, aged had a small pedicled growth, and received a dose of millicurie hours, five weeks later the growth had gre increased in size, so that the patient had to be submit to partial cystectomy—an example of increase in rat growth induced by radon The results were two d one alive with recurrence, five alive and well—four whom needed diathermy to complete their cure In o one case can radon be said to have been entirely succes

In five cases treated with cystotomy, diathermy and open implantation of radon, doses varied from 666 1,332 millicurie hours Healing in three cases was som what painful and tedious until the sloughs came away, b the final healing was good Five patients are alive a well—in three cases periods of five, four, and two and half years have elapsed since the operation, and two

* An excellent rule-scale for calculating the dosage of radon seeds has been devised by Mr M V Maynecord, M Sc of the Cancer Hospital London, and made by Cuthbert Andrews, 47, Red Lion Street, Holborn, London, W C 1

two cases In one of these cases a partial cystectomy is performed for the main growth which was a sessile carcinoma the radon being applied to three small papillomata round the internal meatus In four of these five cases radon can be considered to have been successful

It is in this class of case that radon has appeared to have been most helpful but even in this class two tumours proved resistant and were irritated into more rapid growth and in one case death occurred from the irritation and toxaemia produced by the sloughs It is possible to argue that the diathermy employed in all the cases was sufficient to cure the tumours One can only give it as a clinical impression that the radon when it did not irritate gave additional security against recurrence and shortened the time of treatment

Of the thirteen patients treated two died one had a recurrence, ten are alive and well but four of these needed diathermy afterwards to complete the cure and one needed partial cystectomy as well as radon In only five out of thirteen cases can radon be said to have acted entirely favourably

Group 2—Small Early Sessile Malignant Tumours

These are growths without pedicles the size of the tumour varying from less than 1 to 3 inches in diameter, some papilliferous some ulcerating All could be felt to be infiltrating the base of the bladder

Fourteen cases treated from December, 1922 to March, 1930 consisted of seven males and seven females

Patients treated by diathermy and radon cystoscopically numbered four all females Three are alive and well periods of seven and a half years, two years and four months respectively having elapsed since the treatment All three tumours were very early and small, but were definitely malignant and infiltrating tumours One patient died within four months of multiple deep secondary deposits pyelitis, and uraemia Here the local growth was small and early certainly not larger than a threepenny piece A dose of 999 millicurie hours was given cystoscopically This is one of the five cases in which I have gained the impression that radon has directly caused early and extensive internal recurrences and has hastened death

Nine cases were treated by cystotomy diathermy and radon implantation—six males and three females Two fairly extensive cases were definitely cured by radon Two patients died directly as the result of the treatment Four died of extensive deep internal recurrences three within a few months the recurrences being apparently hastened by the irritation of the radon In one case (a man weighing 16 stone) the radon cured a fairly extensive tumour of the left side of the bladder but eighteen months later a fresh tumour appeared in the right kidney the removal of which led to death from pneumonia

One patient treated by partial cystectomy for the main tumour followed by implantation into the fresh site of the tumour was alive and had no recurrence three and a half years later

Of the fourteen patients treated six survived—one seven and a half years one four and a half year two three and a half years one two year and one six months after operation Eight died—two as the direct result of the treatment four from rapid internal recurrences apparently induced by radon and two from late internal recurrences In only six of the fourteen cases could radon be said to have been successful

It is suggested that radon is more likely than not to be unsuccessful in this class of case Its application has a high mortality and may irritate the tumour and increase the rate of growth Its successes in extensive cases appear as rather lucky shots in the dark I have no doubt in my own mind that I should have obtained better results had I submitted the majority of these cases to partial cystectomy Only six patients out of fourteen are alive and well and in only five of these can the result be attributed to radon In only three cases did radon cause a growth to disappear that was at all extensive In six cases I have no doubt that radon hastened death In two cases however it appeared definitely to delay for a time the fatal issue

Group 3—Sessile Malignant Tumours

One case, that of a woman with a tumour of the right bladder base was treated cystoscopically The tumour completely disappeared as a result of one treatment—a most impressive result Four and a half years later she developed a carcinoma of the right kidney and ureter, which I removed She is alive and well, but is likely to suffer from recurrence

One case that of a man who for a long time refused operation was treated by radon followed by cystectomy The tumour was healed over for nearly two years, then it recurred deeply After an almost complete cystectomy the patient was able to return for a time to normal life but a year after his operation he died of internal recurrences

One case treated by partial cystectomy with radon implantation into a fresh wound was that of a man who died a week later of uraemia death being in all probability accelerated by the radon

Two cases both males, were treated by cystotomy and radon implantation One died of exhaustion from sloughing five months later he would probably have been more comfortable and lived longer if he had been left alone One survived eighteen months the growth in his bladder shrank to small dimensions and he was relieved of his bladder symptoms but he died of deep recurrences

Of the five patient treated four died one is alive and well, but likely to develop recurrences

SUMMARY OF RESULTS

In twelve out of the eighteen patients still alive radon following diathermy appeared to destroy a bladder tumour but in only four of these cases was the growth at all extensive In the other six cases it was unsuccessful In eleven of the fatal cases radon either caused death directly or appeared to accelerate the progress of the disease In only three of the fatal cases did it appear to delay the final issue The chances therefore seemed to be about even as to whether radon would act as a cure or to act as a dangerous irritant Of the twelve cases cured by radon a cure might have been obtained in eight had they been submitted to diathermy alone or to excision alone one wonders whether we are justified in employing radon in bladder tumours except in exceptional cases where the growth is in a difficult position or when the patient refuses other treatment Once the word radium is mentioned in any particular case the patient knows he has cancer and thinks he is doomed If radium proves unsuccessful the state of the case is often rendered more painful and distressing Nevertheless it is hoped that increased experience and improved technique may lead to more successful results Radon must be kept as one of several weapons for attack and used in the cases where experience teaches us that it is likely to help

COMMENTARY

Radium and radon are physical agents that by giving off gamma rays may destroy cancer cells in their immediate neighbourhood just as the knife diathermy or the endotherm needle can destroy cancer cells by cutting them away or by overheating them Radium at first sight appears to destroy cancer cells with less mutilation than any of these other agents but the results are often fallacious The superficial parts of a tumour may disappear while the underlying portions are left to carry their ravages to deeper structures One gains the impression that if the deeper portions of a tumour are not destroyed then it may in certain cases extend more rapidly than if it had not been treated by radium It is suggested that radon in such cases damages the natural defences of the tissues against cancer cell

In the case of bladder tumour if it were possible to know beforehand the exact susceptibility of each individual tumour to gamma rays and to estimate the exact extent and size of the growth so as to be able to seed the growth not only superficially but deeply with accurately spaced doses and if it were possible, which it is not to exclude secondary beta radiation and so entirely prevent burning and sloughing and if it were possible to use very large doses of radium without damaging the neighbouring

organs of the body as a whole, then we should have in radium an ideal agent for dealing with the problem. Unfortunately none of these criteria can be fulfilled with certainty, so that the application of radium tends to be rather a shot in the dark, even in the hands of those who have had considerable experience with it. The unfortunate thing is that if radium is used and it fails, the state of the patient may be more miserable than if it had not been used at all.

Radium has shown such promise in dealing with early cases of cancer of the lip, tongue, and cervix that it was hoped it might be equally helpful in early cancer of the bladder. But it appears that the problem of applying radium in the bladder produces certain effects which may be of grave consequence, effects which are not troublesome when a cancer opens on to the skin, mouth, or vagina. In such situations, if burns or sloughs are produced, there is a free exit for dead or septic material. In the case of the bladder there is no such free exit, even if a large tube is placed in the bladder and kept there for some months.

It seems to be accepted that in the average case a screened seed containing 1·5 millicuries of radon, acting for ten days, can destroy 1 c.cm. of malignant tissue around it. It is to be noted, however, that some tumours are less susceptible than others. At first sight, then, the problem would appear to be a simple one. Estimate the number of cubic centimetres in any given case, and implant a sufficient number of screened seeds at a distance of 2 cm. apart, and you should destroy all the growth. But things do not always work out so simply in practice. The gamma rays stimulate the fibroblasts, so that scarring is produced, which may be harmful. They also produce obliterating endarteritis in the vessels supplying a growth, so that an excessive amount of sloughing may occur, and sloughs in the bladder may prove troublesome and even dangerous. However heavy the screening, a small percentage of beta rays always leaks through the screens. Apart from this, the gamma rays themselves set up secondary beta rays when they strike the tissues. Beta rays destroy and irritate the normal tissues and cause burns, which in the bladder may become septic.

It is difficult to estimate the exact size of a bladder tumour, and so estimate the dose of radon required for its treatment. Cystoscopy gives little help, as the apparent size of a growth, as seen by the cystoscope, varies with the distance at which the lens is held away from the growth. Attempts to estimate the size with a finger in the vagina or the rectum are liable to error. Even with the bladder open it is often difficult to estimate the extent of the deeper portions of a growth. The nearest approximation that can be made to estimate size is to take X-ray pictures with the bladder filled with air or with some opaque medium. These shadows, however, exaggerate to a certain extent the exact size of a growth, and do not give more than an approximate idea of the size of the root of the tumour.

The size of the growth having been roughly estimated, it appears that it is best to implant the growth with a number of seeds each containing a small dose of radon. These were usually left in to allow them to act for a long time. Small doses applied for a long time over a wide area are much more effective than large doses applied for a short time.

The difficulties of estimating and regulating the dose account for some of the failures.

Diathermy

Diathermy how large a dose of radium is safe to use for the bladder in particular. In July 1926 after that he agreed that it is not safe to use platinum and containing 20 millicurie hours to a tumour. radon. These were usually left in to allow them to act for a long time. Small doses applied for a long time over a wide area are much more effective than large doses applied for a short time. The difficulties of estimating and regulating the dose account for some of the failures.

3 In cases of early infiltrating carcinoma whether papilliferous or ulcerating confined to one side of the bladder I shall return to my original practice which I have employed since 1910—namely wide extraperitoneal resection of the bladder wall with reaction and reimplantation of one or even both ureters Into the fresh wound so made I shall hesitate to implant radon seeds, as I fear that these will delay or prevent proper healing Experience has taught me that the mortality from resection is no higher than if as high as the mortality that results from attempts to treat such growths by ruder while when it comes to permanency of cure radon is simply not in the same street with resection I have obtained a large number of cures with resection for this type of growth many of the patients being alive and having no recurrence for fifteen to twenty years after their operations whereas it is only in the most exceptional circumstances that one sees advanced cases free from recurrence for more than three to four years after an attempt to treat them by radon (four out of fourteen cases) The explanation seems to be that by resection we do often actually remove all the growth present while with radon we tend to treat the superficial parts of the growth only with the result that though the growth heals over for a time yet later on it recurs in the depth and gets beyond hope of cure

4 When it comes to the question of dealing with extensive infiltrating carcinomata I believe that it is dangerous to open the bladder and attempt to implant the growth with a maximum dose of radon The results in such cases seem to be disappointing Though the bleeding may be stopped for a time yet extensive and painful sloughing may occur, and this may lead after three or four months of permanent suprapubic drainage to a painful and trying death Suprapubic drainage in such cases is of doubtful value, and a more comfortable ending is secured if the ureters can be transplanted into the rectum In suitable cases a total cystectomy can occasionally be performed If the patient refuse to submit to such procedure I believe that it may prove a wiser plan to implant these extensive growths with a medium dose of radon cystoscopically and to repeat the dose in three to four months Some months later the case might be submitted to deep x ray therapy which may turn out to be more effective if applied after a tumour has been treated with mild doses of radon than it is if employed alone at the beginning of the treatment

Many years of patient observation must elapse before we can get a final judgement on the difficult question of radium treatment So far, radon has not come up to my expectations and I do not yet feel disposed to recommend it as a first line of defence I shall continue to put my trust in diathermy and resection as the two most effective weapons against bladder growths

In regard to the application of radon to the bladder I cannot help asking Is it as safe as it is said to be? Is it not rather alarming that radon should kill some patients quickly, should accelerate the rate of growth in others and, even when it causes delay, should not infrequently add to the patient's suffering? Are we justified in using it despite these results because it occasionally produces a striking but rather lucky cure? Are we not in danger of forgetting the remarkable results that can be obtained by resection in our enthusiasm for a new method, which is so much easier to apply but which we may be tempted to employ to save ourselves the earnest endeavour needed to fit ourselves to carry out resection?

THE RADIUM TREATMENT OF GENITO-URINARY CANCER*

BY

A CLIFFORD MORSON, O B E F R C S,

SURGEON TO ST PETER'S HOSPITAL FOR URINARY DISEASES

At St Peter's Hospital, London, during the past five years 100 cases of carcinoma of the bladder, prostate, and penis have been treated with radium by my colleagues and myself This research has been carried out with the support of the Medical Research Council and the Empire Cancer Campaign Of the 100 cases 58 were bladder growths, 35 were carcinomas of the prostate, and 7 penile cancer

CARCINOMA OF THE BLADDER

With regard to bladder growths various techniques have been tried They include the introduction through a cystoscope of emanation seeds, the latter being left in position until voided in the urine or retained permanently in the bladder wall

An extended trial was given to the following technique A suprapubic cystotomy was performed and needles containing the radium salt were buried in the growth in such a manner as to give homogeneous irradiation of the whole mass This is possible only if the needles are inserted into the periphery of the tumour outside the bladder as well as on its mucous surface, and applies to the ulcerative variety only

In the cauliflower type the tubes were buried in the base only The spacing of the tubes was about 2 cm and the quantity of radium element in each either 1 mg or 5 mg, the time of exposure varying from one to six days Screenage used was platinum 0 5 mm thick

Modifications of this technique consisted in removing the cauliflower mass down to its base with the diathermy knife before inserting the radium, and also injecting the tumour with 2 per cent fluorescein

The only advantage gained by the cystoscopic method is that the bladder is not opened Apart from the obvious danger of leaving foreign bodies in the bladder wall which collect phosphatic deposits around them (see drawing) it is absolutely impossible to determine the extent of the growth with the aid of the cystoscope alone Excluding the use of the microscope and the x ray tube the limits of any cancer can be defined only by digital exploration Experience alone develops this cancer touch in the fingers On these grounds therefore, the technique may be dismissed as inefficient

Of the fifty-eight bladder growths, thirty were treated by myself, by open operation over a period of five years Not one of these cases can be said to have been cured, though it must be made quite clear that the cancer was in an advanced stage A portion of growth was removed at the time of operation to prove the presence of an infiltrating tumour and to exclude the diagnosis of papilloma

A drawing of a phosphatic calculus which contained two radon needles and was adherent to the bladder wall

On the credit side two facts stand out First with few exceptions, for a space of six to eighteen months, the distressing symptoms of urgency and pain on micturition were in abeyance but they then reasserted themselves, with the result that there was a steady decline in the general state of health Cystoscopy during this period showed a bullous oedema of the area of mucous membrane irradiated and when the tumour was of large size a mass of dead growth surrounded by a raised edge and covered by what looked like normal mucous membrane As time goes on the patient dreads dilatation of his bladder and cystoscopy, even under an anesthetic affords little assistance for the study of pathological changes

The second fact—and it is a remarkable one—is that however severe a haemorrhage may be it can be controlled by irradiation of the whole malignant mass, but the dosage must be comparatively large—that is, tubes containing not

* A communication to the Section of Surgery at the Annual Meeting of the British Medical Association Winnipeg, 1930.

less than 5 mg of the element should be left in position for twenty-four hours A small quantity with a long exposure is useless in these cases I know of no agent—chemical, thermal, or electrical—which is so reliable a haemostatic as radium I recall two cases where it was feared that the patients might die of exhaustion before the growth could be irradiated Blood transfusion appeared to give each patient the necessary strength to withstand the operation of suprapubic cystotomy The control of haemorrhage by irradiation was complete within twenty-four hours

One had hoped that better clinical results would have been obtained by the use of needles containing 1 mg each of element, with an exposure of about six days, but it has been found very difficult to keep the tubes buried in the growth for longer than two or three days They then fall out into the cavity of the bladder The displacement appears to be due to two causes—namely, the necrosis of cells immediately in contact with the needle and the muscular act of defaecation

It is a striking fact, confirmed by numerous observers, that bad results are to be expected from radium irradiation where severe sepsis has intervened upon a malignant tumour I know of no exception to this rule In vesical carcinoma, complicated by infection, after irradiation, the disease makes rapid progress, and a temporary control of haemorrhage is the only advantage gained by the use of this method

It was hoped at one time that the painting or injection of fluorescein into the tumour, when the cells are exposed to irradiation, would improve our results, but there is no proof that the patient benefited in any way from this technique On the other hand, the combination of diathermy with radium, in removing a large mass of growth within the cavity of the bladder at the time of operation has given immediate relief

CARCINOMA OF THE PROSTATE

An account of the results of the radium treatment of carcinoma of the prostate does not encourage the hope that patients suffering from this type of the disease can be cured by this method In the majority of cases, when the disease is detected by the doctor the growth is no longer hemmed in by the capsule of the prostate, and no local-acting agent like radium will destroy it

If radium has no curative effect upon this type of glandular carcinoma, can symptoms be relieved and life prolonged by its use?

Seventeen years ago I commenced a study of the radium treatment of prostatic cancer, and between 1913 and 1923 inserted radium tubes by the perineal route into fifteen patients The immediate results were satisfactory, the tumour shrank in size, and in some cases seemed to have disappeared There was a reduction in the frequency of micturition, and in two cases of retention normal micturition recommenced As the months passed, however these patients returned, complaining of increasing difficulty in passing water, and later some of them developed retention, requiring suprapubic cystotomy Very few of these patients survived two years, and all except one were dead within four years Post-mortem examinations carried out on two patients on whom suprapubic cystotomy had become necessary, following irradiation revealed contraction of the ureteric orifices and atrophic kidneys

That radium often destroys the malignant mass I have not the slightest doubt, but the anatomical position of the prostate is a stumbling-block Whether a small dose of radium is employed over a long period, or a large quantity for only a few hours, there is a stimulation of the connective tissue cells by the rays The resulting formation of fibrous tissue leads to serious complications in tiny ducts like the ureters

A study of the pathology of prostatic cancer has revealed to me that the lower ends of the ureters are commonly encased in malignant tissue The danger, therefore, of replacing the carcinoma cells by even a minimum of fibrous tissue is obvious I have performed a post-mortem examination in a case of carcinoma of the cervix, treated by the most fashionable technique in England to-day, where the radium had completely destroyed the malignant growth but left the ureters contracted by fibrous tissue The clinical manifestations of this fatal complication had occurred two years after the patient had been discharged from the gynaecological clinic as an apparent cure I have now entirely abandoned the perineal route, as by it homogeneous irradiation of the cancer, which has extended far beyond the boundaries of the prostate, is impossible I am carrying out the technique advocated by Herbst of Chicago who performs suprapubic cystotomy and irradiates the bladder base and prostate from within the bladder An additional advantage of this method is that the surgeon is able to determine whether the disease has extended beyond the interureteric bar If it has, radium treatment is out of the question As yet I do not feel justified in expressing an opinion on the results of radium treatment by the suprapubic route, but I must frankly admit that at the best it is unlikely to be as satisfactory as the radical operation of excision of the gland and bladder base

CARCINOMA OF THE PENIS

A study of the effect of irradiation upon carcinoma of the penis brings us much nearer the possibility of cure than that of cancer of any other genito-urinary organ The reasons for this optimism are as follows

1 Cancer of the penis is a local disease, and never gives rise to general dissemination, as is observed in a glandular carcinoma I wish to stress the point that lymphatic involvement is confined to the inguinal glands This observation has met with criticism from some distinguished urologists, but I am unshaken in my belief that I have given a correct picture of the clinical course of this disease in my paper read before the Section of Urology of the Royal Society of Medicine in January of this year It has a most important bearing on prognosis

2 The most sensitive of the carcinomata to irradiation is the squamous-celled variety, which is the type met with on the penis

3 In cancer of the penis, being a surface growth, more than one application of radium can be given without any disturbance to the patient, such as occurs in the deep-seated tumours of the urinary tract

4 This disease of the penis can be cured by amputation Therefore if radium causes disappearance of the primary lesion it is strong presumptive evidence that the final results will be as satisfactory as that produced by surgery

It is unfortunate from the research worker's standpoint that in England carcinoma of the penis is a rare disease During the past five years seven cases have been treated at St Peter's Hospital with radium In one of these, which was very septic and had a most offensive odour, irradiation failed to produce any result, and eventually the organ had to be amputated All the other patients benefited enormously by radium treatment The tumours disappeared, and thus permitted both the genital and urinary functions to act normally

The technique to date has been to use platinum needles, 0·5 mm thick, with over-all length of 22·5 mm, each containing 5 mg of the element, and to bury them in the growth about 2 cm apart, so as to produce homogeneous irradiation of the whole tumour For the initial exposure each needle has been left in position for twenty-four hours, for every subsequent one, thirty-six hours In order to protect the skin of the scrotum and testicles from the rays a lead plate must be placed between these structures and the penis The plate should be sufficiently long to allow each end to rest on the thigh For the introduction of the needles local anaesthesia suffices The changes in the tumour, which can be observed with the naked eye, commence about the third day after irradiation In the papillary variety the projecting parts of the growth become smoothed out, and a thin whitish film, due to keratinization, appears over the whole surface If a lethal dose has been given the tumour will have disappeared in a fortnight When a malignant ulcer is treated the base is replaced by healthy granulation tissue in the course of from ten to twenty-one days, and normal squamous epithelium commences to grow in from the edges The complications of treatment by irradiation are difficulty in micturition, caused by oedema of the urethral mucous

membrane, sloughing—the result of overdosage—and stricture of the external meatus

It is a striking fact that in all except the advanced cases of penile cancer the removal of the primary lesion results in a decrease of the size of the inguinal glands, and in some cases complete disappearance This of course, means that the enlargement is due principally to sepsis, and not to malignant disease The treatment of these enlarged glands depends upon the clinician's interpretation of the pathological processes at work My view is that to dissect out the lymphatic tissue at the same time as the primary growth is eradicated is a most dangerous practice First lymphatic oedema may result, comparable to the condition known as "brawny arm," following the radical operation for carcinoma of the breast secondly, there may be an extensive cellulitis, due to operative intervention in tissues heavily charged with infection

As the malignant cells do not penetrate beyond the inguinal regions it is perfectly safe to allow three months to elapse after the removal of the growth of the penis, in order to observe any changes in the lymphatic tissues As I have already stated, sepsis is the chief factor in causing the glands to enlarge and the elimination of the primary focus will cause the disappearance of the adenitis within a few weeks If at the end of three months the glands are still larger than normal, and the skin over them is thickened, we can be quite certain that these changes are due to malignant disease It is my practice, then, to excise the diseased tissues, rather than to speculate with radium

Surgical Removal of Primary Growth

Finally, we have to answer the all-important question When is the primary growth to be irradiated, and when is it to be removed by operation?

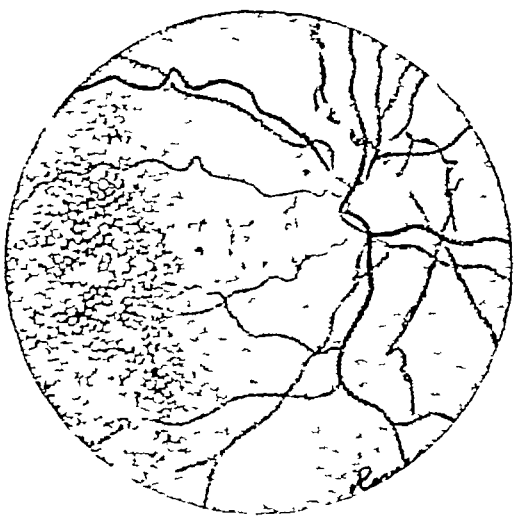
Surgeons are unanimous in their opinion of the value of the Gould operation in eradicating the disease The functional result, so far as micturition is concerned, is also satisfactory There is complete control Narrowing of the external meatus frequently occurs and requires intermittent dilatation with bougies This defect and the loss of the whole organ, are the two great disadvantages of this method of treatment

On the other hand by irradiation the penis is preserved, and though stricture of the external meatus may sometimes result, its frequency is not comparable to that observed after amputation If irradiation fails we can still fall back upon amputation with the knowledge that delay in surgical removal has not eliminated the hope of cure

OPTIC ATROPHY WITH RETINAL CHANGES, CAUSED BY HIGH-TENSION CURRENT

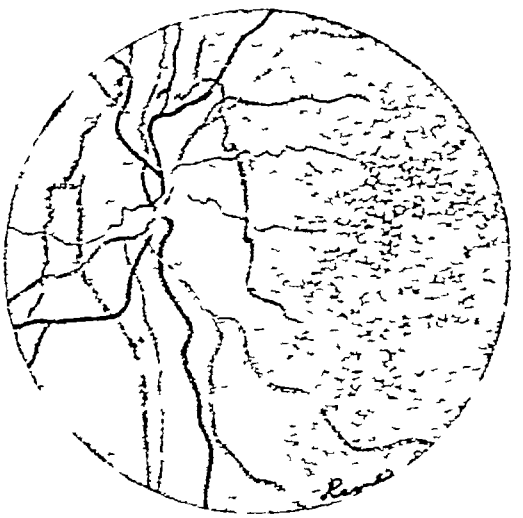
BY

W BAINBRIDGE, M B , Ch B Ed , D P H ,



HONORARY OPHTHALMIC SURGEON HULL ROYAL INFIRMARY
OPHTHALMIC SURGEON HULL EDUCATION COMMITTEE.

I PUBLISH the following case because similar cases must be rare and it deserves to be recorded The history was given to me as follows



In June 1927 the patient aged 31 an acetylene burner by trade was going into an electric crane to do some repairs when he happened to take the wrong lead to the crane and got a shock with a current of 480 volts A C He was taken to the local hospital His left wrist was burned and also his toes His eyes were bloodshot for four month He received no treatment for them in the hospital because he did not complain about them they did not hurt him and his sight was not affected He was in the hospital for a month or five weeks Six or seven months afterwards his eyes became misty and used to hurt him He went to his doctor about them who advised him to see the nearest eye specialist who tested his eyes and prescribed glasses As his eyes still troubled him he again visited his doctor who sent him to the Hull Royal Infirmary where I first saw him on October 8th 1929 Regarding the family history he has three sisters and five brothers all with good sight his father and mother have also good sight.

The condition of his eyes when first seen was as follows Pupils active to light and accommodation Conjunctivae and corneae normal Right eye vision 6 36 The fundus examination showed the disc to be pale and atrophic and the arteries slightly smaller than normal There were a large number of rounded white area in the macular region surrounded by pigment To the nasal side of the disc there was an angioid streak The retina appeared healthy in the periphery Left eye vision 6/24 upper part of the disc pale There were similar rounded areas to those seen in the right eye and angioid streaks on either side of the disc The periphery showed retinal degeneration A small degree of myopic astigmatism was present in the right eye and a small degree of myopia in the left Both fields of vision contracted all round

Wassermann reaction negative urine normal He was examined by Dr Muir honorary physician to the Hull Royal Infirmary who reported that he could find no disease of the central nervous system I saw him again on October 15th 1929 January 10th 1930 and May 13th but the condition of his eyes has remained the same

Right eye.

Left eye

As the case was one of peculiar interest I sent him up to London to see Mr A H Levy surgeon to the Central London Ophthalmic Hospital who reported as follows

The fundi show most peculiar changes Besides the optic atrophy which is well marked in the right there are macular changes and also vascular changes The brown lines look somewhat like angeoid streaks except for their colour and the whole gives me the impression of a very slow non-infective inflammatory process

Mr Levy considered that the condition had definitely been caused by the accident

Ocular injuries through electricity are not common, as shock of sufficient severity to produce fundus changes is generally fatal The modes of injury are as follows lightning, exposure of the eyes to electric flash, and electric shock

The following fundus changes have been reported

(*a*) Hyperaemia, oedema, changes in calibre of arteries and veins

(*b*) Localized lesions, including scar formation observed round disc (Terrieu), near macula (Haab) Hole at macula with pigmentation at periphery (Kramer)

(*c*) Fully established choroido-retinal changes, with and without gross interference in visual acuity (Lundsgaard, Junius, Schirmer, Robinson, and Terrieu)

(*d*) Choroido-retinitis leading to detachment (Lundsgaard)

(*e*) Detachment in one eye and optic neuritis in the other (Pfahl)

(*f*) Optic atrophy (Ulbrich, Hess, Junius, Dor)

I am greatly indebted to Mr Levy for his assistance in looking up the references to reported cases also to Messrs Rayner (Hull) for making drawings of the fundi reproduced

MAJOR DERMATOSES OF CHILDREN.

BY
W J O'DONOVAN, M D,
PHYSICIAN, SKIN DEPARTMENT, LONDON HOSPITAL

A "dermatological bad bargain" must be our first consideration Chronic seborrhoea capitis is not dramatic, it is unpleasant to look at, inveterate in its resistance to ordinary treatment, it is a bar to the education of its owner, a hindrance to its possessor's marriage or employment, and, throughout its course, a means of reproach to the profession I shall first describe the clinical picture as we see it in young children, outline its clinical variations and complications, and suggest a line of treatment that I have most frequently found to be efficacious

CHRONIC SEBORRHOEA CAPITIS

The disease appears, when developed in a child of 5 or more years of age, as a scalp condition whose history is seldom definitely obtainable The scalp is red or pink, scaling all over, and generally dry Moist patches from exudation of clear serum are covered with heaped-up minor aggregations of damp, yellowish scales Over the greater part of the head the pink surface is dry, and covered with copious, easily detached white scales The hair has no lustre its surface, if dark, is grey Generally the hair is plentiful, but at times in an exacerbation of the disease there may be a general loss of hair producing notable alopecia, regrowth is the rule Were the condition confined to the scalp it would be bad enough, but extensions on to the body are frequent, particularly to the flexures The folds of the groins, the umbilicus and the armpits, although hairless, are red, and covered with copious, easily detached white small scales At times all these sites may be moist exude freely, and show scabs and macerated epidermis heaped over the reddened surface as a pale yellow malodorous and pultaceous accretion During acute phases it is common for a moderate adenopathy to develop in the neck and groins These children otherwise are well, but particular attention should be called to a hall-mark of skin chronicity which they invariably show The eyelids are reddened at their margins, while yellowish crusts are formed at the roots of the eyelashes The lids are pink and roughened from frequent rubbing matted bunches of eyelashes are often seen, and a considerable disfiguring loss of eyelashes takes place also In about one-third of the cases two further extensions can be seen First, the eyebrows may be involved their site is reddened and scaling, or moist and scabbed Secondly, behind the ears red fissures may develop, the surface of the ears is thickened, while stiff and matted scales and caked exudate often cover a retained wax crescent of attachment of the auricle to the scalp Both sexes are afflicted with an equal incidence The disease is far more common in hospital and institutional practice than in private practice For this, the factors of heredity, uncleanliness, a disinclination on the part of the parents to perform unpleasant dressings, and improper feeding must be taken into account Although superficial pustular dermatitis speedily clears up when removed into the hospital surroundings, nevertheless the scaling erythema of scalp and flexures remains, apparently responding to changes in diet, climatic changes, or to variations in the general health It is soon borne upon the observer that these patients have a fragile skin, they are placed sensitive, and exposure to the sun on a bright day rather pink skin red, and red areas moist These patients respond by aggravation if they are washed with any household soaps, or if mercurial ointments are applied in an attempt at antibacterial treatment Such children are not of the nervous type so brilliantly described by Cameron They do not suffer from dental sepsis there are no signs of intestinal toxaemia, and their differential blood count is normal They are not anaemic, or wasted, or mentally dull, although they have a strange tolerance of their persistent malady

In treatment, personal cleanliness is of the first importance underclothing and bed linen should be changed and boiled daily We can assume that by the time these cases have reached the specialist's hands, bland treatments, such as bran baths, calamine liniment, various zinc ointments, soft paraffin dressings, a period of salt free and also of low sugar dietaries, have already been tried without success Thyroid extract and ergosterol may have been exhibited, and yet the disease remains My practice is to order an x-ray epilation to the whole scalp at once If the child is an inmate of an institution, or under the care of an authority through which such a treatment is not easily obtainable, I prescribe thallium acetate 8 5 milligrams per kilo of body weight, dissolved in a draught of sweetened water Whilst awaiting the epilation that should occur after a latent period of three weeks I swab the scalp and any other lesions with a 2½ volume peroxide lotion This is speedily mopped away with both Sir Lenthal Cheatle's malachite green, which is a solution composed of equal parts of 2 per cent malachite green in 80 per cent alcohol, and 2 per cent mercuric chloride in 80 per cent alcohol This application is, to some patients, painful for a short time at first, but it is an invaluable aid for infected dermatoses The scalp should be cropped closely before the application of x rays or giving of thallium, so that local medication may be facilitated The backs of the ears, the axillae, and the groins should also be sprayed Frequent application of white lint fomentations for twenty-four hours, or a starch poultice, is occasionally needed before a direct attack can be instituted in this manner Application of unguentum hydrargyri oxidi flavi to the eyelids twice a day is also advisable A watch must be made for bed wetting, and naturally constipation will receive proper treatment It is a common tradition that soap and water is bad for the patients Hard water and common soaps undoubtedly are, but I have never regretted bathing these patients daily, using Midgley's or Allen and Hanburys' basic over-fatted soaps, a second water is always used, however, to remove any curds from the skin, and hot, soft towels are advisable to lessen the need of skin friction and to shorten the washing process, since, in winter, these children frequently develop attacks of bronchitis

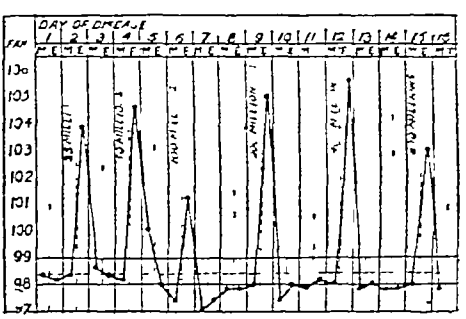
During treatment, patients are kept in bed, and at the last stage in the latent period after x-ray treatment, it is highly advisable to use the weapon of protein shock therapy This is best given on the nineteenth evening after the x-ray treatment, so that the period of fever corresponds to the time of epilation The customary dose

I employ is 0 1 c cm of T A B injected intravenously The febrile reaction is treated with general heat, hot drinks, sal volatile and aspirin When the hair falls, I change over to lotio glycerini plumbi subacetatis applied to the head and to the other lesions thrice daily until the pink flu h has gone and the skin texture is natural This treatment is truly severe but the dreadful outlook of these patients—if not cured—demands courage and resource on the part of the physician in no way different to that needed by a surgeon dealing with a grave malady

Flexural Prurigo

The second major affection of children is flexural prurigo Essentially this condition starts at the teething age with a few, or many papules of strophulus that are often termed 'lichen urticatus" or papular urticaria of infants From the onset of this usually minor malady the child is seldom completely free from skin trouble Sometimes the mother says the child s skin is affected when exposed to the sun and to the east wind, others say the child is only free when at the seaside in the salt water But, as the years go on the malady changes and presents an eruption of a constant type it is found commonly at the bends of the elbows knees, and wrists less so in the groins rarely on the scrotum and penis, sometimes the skin is harsh purplish and thick, while small boils and excoriation may be present or absent The parents or nurse will always volunteer the statement that the child scratches whenever it is not busily occupied The patient is always of a nervous, sensitive, irritable, emotional make up teeth grinding is common, nail biting and bed wetting are also frequently present In some ca es the parents will giv a history of epilepsy, of asthma, or of migraine in the family Pallor of the skin is often a common concomitant ichthyosis may be pre ent In this connexion we must remember however, how Dr H Barber of Cur s has stressed the unity and importance of the eczema asthma-ichthyosis-prurigo complex The patches of thickened skin or lichenification that we are considering may be small defined round areas 3 to 4 cm in diameter they may be bands along the course of the borders of the popliteal space they may be large quadrilaterals filling the skin area of the bend If, as seems to be the case prurigo is now accepted to be not a disease of the skin but essentially a subjective irritation in which the skin appearances are secondary to rubbing scratching and medication then these cases are truly prurigo The differentiation between pruritus as a symptom and prurigo as an eruption accompanied by itching is artificial The existence of a primary papular *localized pathological skin change* that cau es intolerable itching is a disease conception which many dermatologists will not concede If the importance of the itching and the *unimportance of the physical signs* be realized the term "eczema" will not be applied to these ca es for we are dealing essentially with a nervous malady a *disorder of sensation in which a highly suggestible* child has developed a "tic" of scratching, the scratching causes itching, and a vicious circle is perpetuated

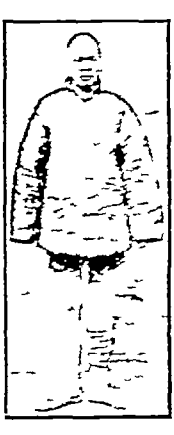
In treating these patients it is well to separate them from a highly nervous watchful, over sensitive mother The affected lesions should be enclosed in pasta zinci or in Unna s paste The arms should be splinted with tubes of corrugated cardboard extending from the axillae to below the fingers Sedative drugs are certainly helpful A child of 5 will derive benefit from the administration of 10 grains of potassium bromide night and morning There is no objection to bathing these children with a bland superfatted soap provided that the dressings are laid out so that immediately after the bath the skin is protected from variations of temperature and is made inaccessible to the child s eyes and fingers movements of air or the touch of clothing will easily bring on spasms of uncontrollable irritation and blood can be drawn in two seconds by an active child Pix liquida is often a most helpful local application itching ceasing after the first twenty-four hours treatment whilst the mother may be entrusted in a minor ca e with a small bottle of pigmentum chloral co which consists of equal parts of chloral hydrate menthol and camphor, and she can rub a drop or two of this into irritable spots at bedtime to ensure a quiet night Autohaemotherapy is of service, 20 c cm of blood is withdrawn from a vein at the bend of the elbow and injected immediately into the buttock muscle This should be done twice a week for three weeks care being taken to grease the plunger to prevent clotting Two spaced exposures each of one third of an erythema dose, of *x* rays to all the affected areas of skin at an interval of a fortnight will be most helpful in refractory cases



Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL.

NON-SPECIFIC PROTEIN THERAPY IN ELEPHANTIASIS



I am prompted by the interest taken during the last few years in this form of therapy to record the following case of elephantiasis in which great improvement followed the administration of protein shock injections

A male Chinese beggar was *admitted to the Civil Hospital on* November 22nd 1929 uffering from a solid oedema of the left leg confined to below the knee Unlike most of his brethren he regarded his deformity as an encumbrance rather than an

acquisition and asked if anything could be done for him The affected limb was fully twice the size of the other and the skin was coarse and thickened digital pressure made not the slightest impression upon it

The patient a native of Tai-nan-fu in the west of Shantung where according to Maxwell *elephantiasis is rare gave a history* of two years duration He was put to bed and the limb was firmly compressed by a crêpe cotton bandage next day he was given an intravenous injection of T A B vaccine containing 25 million organisms and suitably diluted with normal saline solution On the fourth sixth ninth twelfth and fifteenth days increasing doses were given—namely 50 100 200 400 and 800 millions The reactions though severe were never alarming and in each case subsided within twenty four hours From the first a steady diminution in the size and a marked change in the consistency of the leg were apparent the bandage had to be readjusted daily as it became loose

The photograph reproduced here was taken on the sixteenth day when he decided to leave hospital and resume his wanderings As can be seen the limbs are practically identical in size That elastic pressure played a large part in the result is evident from the marks of the bandage which show up clearly in the picture but I am convinced that elastic pressure alone could not have induced such a favourable effect in so short a time even in a case admittedly mild as these cases go

I think that two departures from the usual technique may have been factors in the success which was achieved (1) the shorter interval between the injections and (2) the larger doses of the vaccine I regret I did not take a photograph before commencing treatment but the latter was purely empirical, and I did not anticipate such a happy result

Senior Medical Officer

Reports of Societies.

THE PREVENTIVE VALUE OF HYDROLOGY

At the meeting of the Section of Balneology and Climatology of the Royal Society of Medicine on November 21st, Dr F G Thomson of Bath, the new president, delivered the annual address from the chair

Dr Thomson said that the treatment of certain definite diseases by what was now called medical hydrology appeared to be one of the oldest forms of practical therapeutics, and the fact that certain previously sick people derived benefit from a course of baths and waters had been observed from early times Certain disorders had come to be regarded as specially suitable for this form of treatment Most of the chronic diseases were preceded by a more or less prolonged stage, in which errors of function were the main, and in many cases the only, feature, and when the truism was repeated, that the earlier the stage of the disorder at which the patient sought advice the more chance was there of cure, it was meant that the benefits from any form of treatment were mainly confined to the correction of functional disorder The aims and objects of hydrology were to increase elimination to train the cutaneous responses to heat and cold, thereby improving the circulation of the blood in the cutaneous areas, to secure the irrigation of the muscles and subcutaneous tissue with a free and more active circulation of blood, to improve the adaptability and elasticity of the peripheral circulation, and to improve nervous tone and general metabolism A course of hydrological treatment might be said to constitute a comprehensive and, on the whole, a very efficient form of physiological training and it was a question of how far it might be adapted to serve the ends of preventive medicine Discussing the pre-rheumatic child, Dr Thomson said that, so far as his own experience went, it was almost unknown for children to be sent to a health resort for a course of treatment, such luxuries were almost invariably reserved for their elders and betters, yet he ventured to think that much more good might often be done in these ordinary cases by the course of treatment A great deal could be done to train his cutaneous reactions by simple measures carried out in the child's own home Clinical evidence went to prove that a large proportion of the less severe cases of muscular rheumatism were due either to an accumulation of fatigue products or to autogenous vaccines of gastro-intestinal origin It had been proved that if baths were instituted early enough this treatment might be said truly to be preventive of many of the most painful and crippling effects of fibrositis

It was such conditions as obesity, gout, glycosuria, and metabolic diseases of the menopause which offered the widest field to hydrology as a preventive measure The onset of obesity was not always to be explained by food and lack of exercise Many men and women began to put on weight at middle age simply because, for some reason or other, their sympathetic endocrines became relatively inefficient Among the causes chronic infection, intestinal or otherwise, must be seriously considered The main indications in addition to regulation of diet and removal of any cause of chronic infection, were to promote the metabolism of fat by hot immersion or radiant heat baths and to promote endocrine activity by the stimulating action of massage, douches, needle baths, and so forth The treatment of gout by hydrology had always been regarded as one of the most successful applications The essential treatment of gout must always be the removal of gastro-intestinal putrefaction The preventive treatment of gout offered a wide field for useful activity at many health resorts Although in theory the climacteric must be regarded as a normal phase in the life of a woman and should entail only trifling and temporary inconvenience a large proportion of women at the "change of life" suffered from definite metabolic disorders The middle-aged woman of increasing weight, with a general thickening and loss of elasticity in the subcutaneous tissue, was sufficiently familiar to everybody, and presented disabilities which, if allowed to go on, were going to impose a serious handicap upon her for the rest of her There was no class of patient for whom treatment balneological and allied methods was likely to prove beneficial Relatively hot immersion baths formed a valuable factor in treatment especially when combined with massage douches Finally, Dr Thomson mentioned hyperpiesis or idiopathic high blood pressure All these were themselves capable of wide and active variation in calibre He thought it not unreasonable to assume that the capillaries played a much more important part in determining the blood pressure than was usually recognized and then functional disuse and ultimately organic might be a primary etiological factor The good results of hydrological treatment in the early stages were due to the restoration of the patency of the capillaries

Dr Leonard Williams, in proposing a vote of thanks, said that he had little doubt that the human race in the future would find the adequate and scientific application of hydrology one of the best methods of preserving health and strengthening resisting powers and Dr J F Halls-Dally, in seconding, agreed with Dr Thomson that the increasing knowledge of the capillary system in dealing with arterial pressure cases was likely to be productive of something very useful from the point of view of treatment

THE TEETH AND THE STOMACH

At the meeting of the Section of Odontology of the Royal Society of Medicine on November 24th, with Mr Cecil Schelling in the chair, a paper by Dr A F Hurst was read, in the absence of the author through indisposition, by Dr J F Venables

Dr Hurst said that the normal activity of the small intestine played a part of such fundamental importance to the body as a whole that it was fortunate that the body had a double line of defence to protect it—namely the mouth and the stomach The majority of people were provided with a first line of defence—the mouth—which was potentially capable of epilation to a not make sufficient use of it, food was immune of all being chewed with the result that the membrane was subjected to mechanical chemical, and thermal irritation The gastric juice dissolved connective tissue and it softened though it did not break up, lumps of unchewed carbohydrate The stomach did its inadequate best to perform the functions which the teeth should have carried out In most individuals the second line of defence proved adequate, even when the individual did not trouble to use his first line of defence, or when the latter was impaired When the stomach was all used as a result of insufficient activity of the first line of defence it was unlikely to suffer greatly unless it owner was one of the 10 per cent of people in whom less than the average amount of gastric juice was secreted Achlorhydria was present in a large proportion of cases of chronic appendicitis and infection of the gall bladder it was a very important predisposing cause of intestinal infection, such as typhoid and paratyphoid and was a constant source of danger to residents in tropical countries Pyorrhoea alveolaris, and to a less extent an inadequate chewing surface, thus played an important part directly in the pathogenesis of chronic gastritis and indirectly in that of a large number of other diseases Turning to hyperchlorhydria, Dr Hurst said that dental infection of all kinds had an important influence on the pathogenesis of gastric and duodenal ulcer in individuals who were predisposed by having a constitutional tendency to hyperchlorhydria The treatment of pyorrhoea alveolaris and the extraction of teeth with infected roots were not only important but the successful treatment of ulcer, but played a still more important part in preventing recurrences Much could be done by effective dental hygiene to prevent the swallowing of infective material If this could not be prevented, the stomach should be washed out periodically, otherwise an acute exacerbation of the ulcer might occur

There was a great deal of evidence to indicate that cancer of the stomach was never a primary disease, it was secondary to chronic gastritis or less frequently, to chronic gastric ulcer, so that the prevention and treatment of these conditions might be regarded as an indirect

Dr Hurst added a few
and abdominal operations

pidemiology and State Medicine of the
Medicine on November 28th, with Pro-
Nwood in the chair, a paper on food as
isease was read by Dr J M Hamill
said that well-being was dependent on
redity and environment—and of these
a part which was often underestimated
irate and powerful of all environmental
food, by means of proper food an indi-
ditary equipment could be developed to
tage than by any other environmental means
hen properly fed and well nourished had
powers of resistance to disease The incidence
is in a community appeared to be closely
he food supply It diminished when the food
ample, and increased when the quantity and
he diet became inadequate Troops could with
t hardship when the rations were sufficient and
their needs During the Middle Ages the relation-
een famine and pestilence was well understood
t a simple matter to say with certainty what
nt and suitable food or when a diet might be
s completely satisfactory Man would seem
have eaten everything of an edible nature avail-
ecent researches had shown that the keynote of
diet was variety It was only by variety that
ould obtain all the various constituents essential
n Milk, one of the few foods expressly manu-
by an animal for an animal, was a perfect food
oung and even for the adult milk and milk
formed some of the most valuable foods obtain-
urrent view supposed that primitive man was in
more favourably situated with regard to food
man of to-day but Dr Hamill did not think
l be substantiated Primitive man had to be
rth whatever food was available, and this must
e been scanty, difficult to obtain, and not always
ietetically In this country, in former times
urces were very limited, but to-day the world
s larder Nevertheless, a considerable propor-
he population was living on diets not to be
s ideal Among large sections of the com-
ice was an important factor in determining the
n of diet, and ill-balanced diets were not un-
Inadequate diet conduced towards maldevelop-
lack of resistance to disease Specific instances
ts defective teeth scurvy beri-beri pellagra
a peculiar form of ophthalmia These diseases
he advanced stages in a long train of disordered
activity which in its earlier stages produced
light as to elude all means of detection at
ailable Most of these disorders resulted from
in diet but in the production of rickets a
tor contained in cereals might also play a part
factor in the causation of rickets was deficiency
D but it was impossible to say what degree of
as necessary to produce rickets without taking
t other factors such as the supply of calcium
Vitamin D occurred most richly in the liver
d in fat fish such as the herring also to a less
gg yolk and milk products Milk contained
unt of calcium and consequently there was
of the conditions for calcium and vitamin D

If a diet contained a generous amount of milk it was probable that the supply of vitamin D would be adequate in most cases for the needs of the body Cereal must constitute a large part of the diet of man, and instead of condemning them because they might be unsatisfactory in certain respects, cereals should be used with other food such as milk and fat fish, capable of compensating for their deficiencies It was now possible to reinforce the vitamin D content of food by adding to it ergosterol, or simply by irradiating the food itself with ultra-violet rays There was on the market a margarine to which vitamins A and D had been added with the object of making the product approximate more closely to butter in nutritive value

Another aspect of nutrition was the damage which might be done to important constituents of food as a result of processes which food might undergo in its preparation Until recently it was thought that the canning of fruit and vegetables necessarily destroyed vitamin C By modern improved methods of canning whereby air was excluded less destruction of vitamin C occurred, and tomatoes and fruits were very little affected in this respect by canning The pasteurization of milk was now widely practised and the chemical and physical properties of milk were not perceptibly affected by a temperature of 145° F with the exception that about 2 per cent of the calcium might become indiffusible and some of the small amount of vitamin C which milk contained might be destroyed The degree of destruction of vitamin C during pasteurization appeared to depend in part on the metal in which the milk was heated, aluminium was said to have much less destructive action than copper It was less easy to justify the destruction of the colouring matter of flour by bleaching This colouring matter was carotene which would seem to be a precursor of vitamin A and it might be that in certain circumstances the body relied upon this carotene for an important proportion of its vitamin A supply The treatment of fruit by means of hydrogen cyanide for the destruction of insect life exerted an inimical effect upon the living cells of the fruit and possibly impaired the nutritive value During the long ages of evolution a variety of materials had been pressed into the service of nutrition and the body metabolism had moved along such lines as made it now absolutely dependent on a supply of these materials When a metabolic process had once been established it was not readily to be put aside or modified *Biological research tended more and more to emphasize the importance of the infinitely little in the processes of metabolism Slight changes in the composition resulting from manipulation might produce changes out of all proportion in the nutritive value of a food*

Sir GEORGE BUCHANAN said that while the vitamin supply in the case of growing children and adolescent was beyond all doubt he wondered in the case of adults on ordinary mixed diet whether the presence of a certain amount of a particular vitamin was a very essential thing to be watched An exaggerated importance seemed to be attached in the case of adults to getting vitamins in quantity when, as a matter of fact, a very small amount of vitamin was all that was necessary to metabolism

Sir WILLIAM HALE-WHITE said that he was sceptical with regard to a good deal of the work of vitamins until he had the experience of the war which was very arresting. People in institutions, who had not the opportunities of adding to their food rations certainly showed an increased liability to certain ills, and the incidence of infectious diseases so

Dr KINGSTON BURTON said that the contemporary view as to rickets appeared to be going back to the view which was held fifty years ago At that time it was believed that rickets was due to nothing more than excess of starch and the children with rickets seen in private practice had been invariably stuffed with bread undercooked flour and the various patent foods of the period Some physicians in those days showed that if starch were boiled cooked or converted to dextrine it could be made much less harmful for children

Dr W CRAMER said that deficient diets not merely produced specific diseases but a train of ill health before those diseases emerged the early stages being so elusive that no disease could be diagnosed The reason why this was more obvious with children was that when a child was

ill from any kind of disease it stopped growing He added that in his experiments he had never been able to convince himself that vitamin D was necessary for the adult, it seemed to be solely concerned with ossification

DR THOMAS CARNWATH recalled the Irish labourers whom he knew during his residence in Ireland many years ago Their normal diet consisted of potatoes and buttermilk, with perhaps sometimes a little pork and some tea, but they were fine strapping fellows When they came over to England to help in the harvest they were overfed with protein, and it took them a couple of months to recover He added that it was only by intensive investigation of diets that the food habits of sections of the community could be ascertained, then defects considered, and the slight modifications necessary to bring them into conformity with scientific principles could be made

DR S A MONCKTON COPEMAN pointed out the importance, in addition to vitamins, of what he called the aesthetics of nutrition There was not the slightest doubt that if a person enjoyed his food he was more likely to get benefit from it Dr Copeman also mentioned that for the first time the Zoological Gardens in London were now able to rear lion cubs This was made possible because of a modification of the diet of the carnivora, who were now given small animals newly killed and without preparation The result was that there were now half a dozen thriving young lion cubs in the gardens

DR H C CORRY MANN pointed out the vast improvement in the health of London children of recent years, although the housing conditions in the slums of the metropolis were not greatly altered Two food modifications were responsible, in his belief, for the change One was the introduction of pasteurized milk, and the other was the fact that now a large supply of fruit (oranges and apples) was assured practically throughout the year As a result, summer diarrhoea had practically disappeared, and so had abdominal tuberculosis He also laid stress on the importance of drinking water He believed that water was very important, because it allowed the necessary alkaline bases to be kept in suspension in the tissue fluids

DR H S STANNUS believed that in many of the deficiency diseases there was a positive, not merely a negative, factor He was convinced that pellagra was not a deficiency disease, it was a disease, unmasked in the absence of vitamin, due to the action of a toxin, and he thought the same was true of rickets and of beri-beri

FLEET SURGEON W E HOME recounted some recent work carried out in Hamburg on the relation of food to the incidence of epidemic diseases, and mentioned that it had been found that infectious diseases were less likely to occur in the families of people who had gardens

DR J D ROLLESTON asked whether any guidance could be given as to the much-vaunted vitamin content of wines and alcoholic drinks, a matter on which many statements were made, but authoritative information was lacking

PROFESSOR MAJOR GREENWOOD, in summing up the discussion, remarked that the really practical question was that in this country, which was not self-supporting in the matter of food, but would starve very quickly if left to its own resources, the people did not receive the food they liked but the food they were forced to buy as a result of the commercial conditions existing Whether they always liked what they should like was another question

AMYLACEOUS DYSPEPSIA

AT a meeting of the Liverpool Medical Institution on November 20th, DR L J PICTON read a paper on amylaceous dyspepsia

Dr Picton said that dyspepsia was noticed to follow starchy meals A starch-eating "habit" was recognized, and cure followed abandonment of the habit The form of starch was important, unburst granules occurring in the gluten framework of the bread sponge were insusceptible to the influence of ptyalin Slimy gastritis might be caused by excessive especially unburst, starch as well as by infective catarrh Delay might be caused not only by slimy gastritis, but also, normally, by eating starch and meat together (Pavlov) as in the conventional dietary Satiety necessary for the tranquillity of the stomach was achieved by meat and greens, and an equal filling of starch and meat involved unnecessary digestive labours as well as delay Greens pass quickly (Beaumont, 1833) Ptyal digestion in the mouth and stomach "hopper" may start the cycle of digestive preparation A peristaltic and metabolic "gradient" (Alvarez) was described, and the site of its pacemaker discussed Inhibition of the pacemaker by sensitivation and toxic influences—for example, excess of starch—was suggested Symptoms were due to delay, constipation, and peristalsis in the wrong direction to an abnormal degree through flattening or reversal of the gradient Starch at one meal, meat and greens at another, were advocated in such dyspepsia

Hirschsprung's Disease

MR J B OLDHAM reported two cases of Hirschsprung's disease on which lumbar sympathetic ganglionectomy and ramisection had been performed two years ago with excellent results The first patient, a girl aged 4, whose bowels were only opened every three to fourteen days in spite of prolonged medical treatment, had the left second, third, and fourth lumbar ganglia, with their rami and the intervening cord, removed, and since then the bowels had acted daily without the aid of drugs The second had been attending hospital regularly for eleven years Her bowels acted very irregularly She frequently had to be admitted to hospital with attacks of acute obstruction On many occasions faecaliths 4 to 7 inches in diameter had to be removed, and she had undergone colotomy, coloplication, colostomy, entero-anastomosis, and partial colectomy, but the condition always recurred After bilateral lumbar sympathetic ganglionectomy and ramisection the bowels had continued to move regularly every day without the aid of drugs or diet The technique of the abdominal approach to the sympathetic chain was described, and spinal anaesthesia was recommended An account was given of the varying forms of surgical and medical treatment that had been tried from time to time and the unsatisfactory results they had produced The similarity between Hirschsprung's disease, cardiospasm, congenital pyloric stenosis, and hypertrophic ileal obstruction was described, together with the physiological basis for the hypothesis that all these conditions were due to a hyperactivity, real or comparative, of the sympathetic nervous system Mr Oldham suggested that the excellent results obtained by sympathectomy in Hirschsprung's disease gave proof of the truth of this hypothesis

In the discussion which followed, DR C ALLAN BIRCH said he was interested in lumbar sympathetic ganglionectomy for peripheral vascular diseases, and asked whether this *operation ever produced* any effect on previously normal bowel movements DR NORMAN CAPON remarked that earlier diagnosis of the condition was desirable, and pointed out that in the young baby abdominal distension was by no means invariable It was noteworthy that at least one case had been reported in which severe vomiting and constipation had led to a mistaken diagnosis of congenital pyloric stenosis MR PHILIP HAWE said that it seemed clear that sympathetic resection should have much more chance of success in conditions such as dilatation of the colon, in which sympathetic hypertonia was probably to blame, than the use of sympathetic resection in the treatment of spastic paralysis (Royle) where the underlying physiological principles are far from clear There was some reason to expect that this operation would be extended to conditions of intestinal disorder other than Hirschsprung's disease He had been associated with Mr Monsarrat in a case of advanced colonic stasis which resisted medical treatment for years, but responded in a most convincing way to a lumbar sympathetic ramisection

RENAL RICKETS

AT the November meeting of the Section of Medicine of the Royal Academy of Medicine in Ireland, with the president, DR H F MOORE, in the chair, SIR WILLIAM WHEELER, opening a discussion on renal rickets, referred to the literature on renal infantilism, on uraemia following osteotomy, and on the connexion between rickets and chronic interstitial nephritis Within recent years a definite picture had been painted of an entity classified as renal rickets, in which the clinical *x*-ray and post-mortem findings

were typical There were, however, greater variations, especially in the x ray appearances and biochemical findings

The first case he mentioned was that of a child aged 7 in which renal rickets was suspected owing to the presence of albumin red blood cells and casts in the urine combined with polyuria There were rachitic changes in the chest and cessation of growth The child had blue sclerotics, a condition not associated with rickets X ray appearances of the bones were not suggestive of the renal type of rickets and finally the blood examination was against the diagnosis the Wassermann reaction was strongly positive The case was an unusual one but congenital syphilis probably explained all the phenomena The albumin was intermittent or transitory as it was not found at a later date

In another case the patient suffered from double congenital hydronephrosis Tests were made with intravenous injections of uroselectan There was a stone in the left kidney The stone was removed and the kidney was found atrophied and cystic with a dilated pelvis The x ray report stated that there was pronounced dilatation of the pelvis and calyces on the right side with moderate dilatation on the left which contained the stone The child had undergone five operations for rachitic deformities The x ray appearances of the bones approximated to the description of renal rickets given by various writers After removal of the stone albumin disappeared from the urine but reappeared after an interval The patient was aged 17 but was only 4 ft 3 in in height no taller than an average child of 10 The prognosis was bad

Antirachitic treatment, such as sunlight and cod-liver oil was believed by some authorities to precipitate uraemia Most of the cases recorded had come from the industrial areas in England

Dr A G THOMPSON said that there could be distinguished four clinical types of rickets: ordinary infantile rickets, late rickets, and two peculiar types associated with infantilism—namely, with coeliac disease and with renal infantilism Nearly 90 per cent of the inorganic matter of the bones of young children consisted of tricalcium phosphate, and if calcium and phosphorus were supplied in adequate amount in the diet good bone was laid down In infantile rickets there was a negative balance with regard to these metals as much being excreted as was absorbed In addition the blood phosphorus was very low (2 to 2 mg per cent) although the calcium was usually normal Hence there was an upset of the calcium-phosphorus ratio with consequent failure of ossification This might result from several factors—for example faulty diet lack of vitamin D and sunshine and bad hygienic conditions In renal infantilism although the conditions might be perfect, a peculiar type of rickets frequently developed This was due to retention of phosphorus by the damaged kidney with consequent upset of the Ca P ratio He showed tables giving the chemical constitution of the blood in both the cases compared with that of a normal child a normal adult typical active rickets and typical renal infantilism Dr Thompson did not think that either of these cases was one of renal rickets, although both were very interesting and obscure types of infantilism The first was probably mainly syphilitic, with perhaps a rickety element superadded The second might be a case of healed rickets

Dr R E STEEN mentioned a case of renal rickets which he had seen in Great Ormond Street Hospital and said that the thing which struck him about it was the marked arterio-sclerosis of the vessels The blood urea in this case was high and the blood pressure also was raised He agreed with Dr Thompson that owing to the blood picture in these cases, it was uncertain whether they could be regarded as examples of true renal rickets It was easy to see how antirachitic remedies would be useless in cases of renal rickets In some of these cases some hyperplasia of the thyroid had been noted

Diabetes and Phthisis

Dr J LAIRD showed a case of diabetes mellitus complicated with phthisis

The case was a girl aged 14 who had apparently suffered from untreated diabetes for over six months before entering hospital Soon after admission she developed pyrexia and a cough X ray examination showed early cavitation of the left lung in two places and the sputum contained tubercle bacilli She had an acute and rapidly progressive tuberculosis and the general condition was becoming gradually worse in spite of careful treatment for the diabetes He induced artificial pneumothorax on the affected side and though he did not at first succeed in obtaining complete collapse owing to adhesions the child's general condition began at once to improve Later on he found it necessary to use high pressure of air (about 20 cm water) in the pleural cavity so as to stretch the recently formed adhesions and now (about five months after induction) the left lung was almost completely collapsed Recently a small but harmless pleural effusion had appeared on the collapsed side which possibly assisted treatment The diabetes was well under control

The PRESIDENT said that in 1914, when Allen was working out the dietetic treatment of diabetes, Joslin noticed that in diabetic patients who developed tuberculosis and lost weight the diabetes improved, and in some cases there was a great increase of the glucose tolerance Dr F T FREEMAN said that it was remarkable to find such tolerance to high pressure in a child especially on the left side The patient had a fairly large cavity, which was relatively superficial and the danger of pyopneumothorax was never far off With regard to the effusion if it could be increased in size and brought up to the level of the cavity in the lung, it was a great safeguard against rupture of the cavity

Polycythaemia Vera Rubra

Dr CYRIL MURPHY in showing a case of polycythaemia vera rubra especially discussed its therapeutics The case was as follows

A cooper aged 51 had complained since April 1922, of inflammation of various joints at different times with later the development of pain in the left upper part of the abdomen of headache of lightness of the head and of vomiting on one occasion In late 1923 physical examination revealed the following cyanose-coloured lips lobes of ears and finger tips and a purplish corneal tint The venules of the face seemed engorged a feature still noticeable The spleen extended four fingerbreadths below the left costal margin and was very tender on examination The left knee subsequently became swollen in a spindle-shaped manner while the veins of the leg stood out in relief and the left knee became almost cyanotic This was accompanied by intense febrile reaction which lasted for about fourteen days uninfluenced by salicylates Other joints more particularly of the great toes and wrists were subsequently involved and arthritis became the chief symptom Subsequent examination of the blood showed a negative Wassermann reaction and a red blood cell count of over 11 million per c.mm Later blood counts were 1925 9 million with 30 000 leucocytes 1927 8 million with haemoglobin content of 125 per cent Benzol and various anodynes were of no value in the treatment Later sodium carbonate was given in 10 gram doses three times a day in an attempt to diminish the acidity of the blood This treatment seemed to relieve the condition somewhat and given over a period of a year lowered the blood count by 1 million X rays to the long bones seemed to aggravate the symptoms so that this form of treatment was early discarded Venesection gave temporary benefit The ingestion of phenylhydrazine hydrochloride as used at the Mayo Clinic was tried 0 1 gram of the drug being given per week for over a year The spleen was still enlarged and tender and there was also a slight cyanose hue noticeable on the lips His blood pressure which had been 168 systolic and 97 diastolic was now 142 systolic and 81 diastolic the blood count reading red blood cells 4 500 000 while blood cells 13 200 haemoglobin 80 per cent colour index 9

The PRESIDENT said he had treated four cases of this disease in the last three years—one woman and three men—his results coinciding in the main with those of Dr Murphy One man aged 42, was given phenylhydrazine but with little result X rays were tried also with little result, and then phenylhydrazine was tried again and after about four weeks' treatment the patient began to improve It was now found that 1/10 gram every seven to ten days was enough to keep the blood approximately normal The second man aged 44, had probably had an attack of thrombo-angiitis obliterans in the left radial artery a condition described as a complication of polycythaemia but supposed to be very rare This patient had a course of x ray treatment for three months but the result so far as the blood was concerned was absolutely negative He was now having phenylhydrazine and was improving Dr Moore thought that in these cases x ray treatment rendered the bone marrow more vulnerable to the action of phenylhydrazine

Reviews.

FUNCTIONAL DYSPEPSIA

By *Nervous Indigestion*,[1] which is the title of this book, Dr ALVAREZ means any form of indigestion not due to organic disease. This, of course, is not the meaning always attached to the term. It is more usual to speak of dyspepsia not attributable to organic disease as "functional," and to reserve the term "nervous," if used at all, for those cases in which neither organic disease nor any alteration of the secretory or motor functions of the stomach can be demonstrated. To Dr. Alvarez, however, the presence or absence of alterations in the gastric functions is of no real importance, and it is significant that, throughout the book, such common terms as hyperchlorhydria, atony, and so forth, are not to be met with. He regards all disturbances of digestion which cannot be shown to be due to organic disease as being of "nervous," by which he means psychical, origin, and it is the object of the book to expound this thesis and the treatment which follows from it.

The first chapter is properly devoted to a consideration of the ways in which emotion can affect the digestive tract, with many illustrative examples, both experimental and clinical. In the second chapter a brief but sufficient account is given of the varieties of organic disease which must be eliminated before a diagnosis of nervous indigestion is arrived at, and it is interesting here to note that the author regards cholecystitis as now the commonest disease of the digestive tract. In making the diagnosis of the organic dyspepsias the importance of the clinical history is rightly emphasized, and some useful hints are given on history-taking. Radiography and other special methods are regarded as of secondary importance, and test meals are not even mentioned. The nature of the nervous factors—fatigue, emotional stresses, and so forth—which may lead to disorders of digestion are then considered in some detail and with numerous clinical examples, and the rest of the book is mostly taken up with treatment. The author describes admirably and with considerable humour the handling of nervous patients, and his directions for symptomatic treatment are clear, simple, and entirely free from fads. The over-use of roughage in the diet and of paraffin as a laxative are condemned, while stress is laid on the benefits derived from rest, a smooth diet, and sedatives. In a final chapter—which, along with the quotations at the beginning of each section, might have been omitted—suggestions are given for "further reading," in which among the authors recommended are to be found such curious juxtapositions as H. C. King, J. B. Nichols, D. H. Tuke, Hippocrates, and R. L. Stevenson!

We can cordially recommend this book both to the specialist and to the general practitioner. It treats of a difficult subject with clarity, humour, and common sense, and it expounds and illustrates the sound doctrine that the treatment of functional dyspepsia must be mainly by the methods of psychotherapy.

"ROSE AND CARLESS"

DESPITE increasing competition, *Rose and Carless' Manual of Surgery*[2] still remains first favourite with the average medical student and is to be found upon the bookshelf of most practitioners. No book that had not exceptional virtues could reach a thirteenth edition (indeed, if reprints and foreign translations and editions be included the present is the twenty-fifth edition) without suffering some diminution of popularity, and we believe, therefore, that this work, taking it as a whole, supplies the needs of the student and of the practitioner more closely than any other.

The present edition marks a definite milestone in the history of the book, owing to the retirement of Mr. Albert Carless from active participation as editor-in-chief. As he says in his valedictory preface: "The constantly recurring testimony of those whom I have met in all parts of the English-speaking world makes me realize with much gratitude that this effort has not been in vain. . . . The old title will be retained, and I am glad to think that my name and that of my colleague Rose will still be remembered. The work has been my main contribution to the profession which I have loved so truly and striven to serve faithfully." Mr. CECIL WAKELEY, who has assisted in the production of the last two editions, now becomes editor-in-chief, and Mr. J. B. HUNTER has joined him as collaborator. The general arrangement of the book, with which most are familiar, remains, but since the eleventh edition was reviewed there have been considerable changes in detail. Many of the chapters have now been revised or written by specialists in particular branches, thus the opening section, on pure pathology, is in the hands of Dr. Carnegie Dickson, and the fresh illustrations of microscopical sections by Mr. Richard Muir are here particularly noteworthy. Mr. Negus has undertaken the section on diseases of the ear, nose, and throat, while the new chapters on the surgical affections of the eye and the surgery of the female genital organs have been written by Mr. Bishop Harman and Mr. Eardley Holland respectively. The chapter on military surgery appearing in previous editions has been omitted, but its place is taken by one on tropical surgery by Sir Frank Connor, the final chapter, on anæsthesia, has been brought up to date by Dr. Hadfield.

Radiograms seldom give good reproductions on ordinary paper, and in recent editions of "Rose and Carless" this difficulty has been overcome by the use of special art paper plates grouped together at the end of the volume. The radiograms thus collected are actually fewer in the present edition, but Dr. Graham Hodgson and the engravers and printers are to be congratulated on having produced one of the best sets of radiographic reproductions appearing in an English book. In the main part of the work there has been little alteration of text, but here and there paragraphs have been added to bring the matter up to date, and others describing ideas now obsolete have been deleted. The treatment of malignant disease by radium, of varicose veins by injection, and of burns by tannic acid have all received notice. The size of the page has been increased, and the familiar binding has given place to one of maroon cloth with gold lettering. We miss the dedication to Lord Lister—an omission breaking that tradition of continuity with the greatest of English surgeons which the book formerly upheld.

The medical student as well as the practitioner will find the latest edition of "Rose and Carless" a faithful vade-mecum.

TUBERCULOSIS IN CHILDHOOD

THE second volume of ENGEL and PIRQUET'S Tuberculosis in Childhood[3] worthily completes a great undertaking—the survey and full record of modern knowledge of the disease in all its aspects. The first volume, of which a review appeared in this *Journal* on April 26th, dealt with bacteriology and pathology and with all the clinical expressions of the disease in their bewildering variety. There still remained the special methods of diagnosis, questions of prognosis, and therapeutics by prophylaxis and by treatment of the disease in its latent and active forms. These and other fragments of the subject form the material of the present volume, which, although hardly so big as the first volume, runs to 700 pages, and is the combined work of nearly forty contributors.

The importance of the subject, the careful editorial plan of the book, the reputation and authority of most of the contributors, and the lavish use of illustrations, have already been emphasized in our review of the first volume, and these qualities also mark the second volume. Thoroughness and copiousness (sometimes tending to overflow) are the hall-marks of the whole book. Thus, in the section on diagnosis, there is a careful account of all the methods

[1] *Nervous Indigestion*. By Walter C. Alvarez, M.D. London: W. Heinemann (Medical Books) Ltd. 1930. (Pp. xvi + 297. 15s. net.)

[2] *Rose and Carless' Manual of Surgery*. Thirteenth edition, edited by Cecil J. Wakeley, F.R.C.S.Eng., F.R.S.Ed., and John B. Hunter, M.C., M.Chir., F.R.C.S.Eng. London: Bailliere, Tindall and Cox. 1930. (6½ × 9¼. pp. xii + 1692. 664 figures, 19 plates, 43 figures in x ray supplement. 30s. net.)

[3] *Handbuch der Kindertuberkulose*. Herausgegeben von Prof. Dr. St. Engel und Prof. Dr. C. Pirquet. Zweiter Band. Leipzig: G. Thieme. 1930. (Imp. 8vo, pp. x + 887–1591, 170 figures. M. 1.0.)

for using tuberculin in diagnosis and also a detailed description of more recent tests complement-fixation, flocculation, and sedimentation, the discussions on prophylaxis are enriched by a large series of observations upon children at the age of 7 years infected and non infected and upon the fate and condition of the same individuals at the age of 20 The climatic treatment of tuberculosis is detailed with great elaboration first, the physical qualities and physiological effects of sea air and mountain air then a series of chapters dealing with sanatoriums all round the seaboard of Europe and over the Alps There is a chapter on the climatic treatment of extra pulmonary tuberculosis by Dr Bernhard of St Moritz and special surgical measures both orthopaedic and the more recent surgical operations in pulmonary tuberculosis, are fully described in two other chapters Lastly may be mentioned epidemiological studies, based on mortality statistics, post-mortem examinations, and the Pirquet test and an account of the laws and statutes and the medical and social organizations for the control of the disease both in the Old and in the New World

This enumeration, not complete of the subjects of the second volume will suffice to indicate the aim and the scope of the whole book—the complete presentation of modern knowledge of tuberculosis in childhood The book is a great and valuable storehouse of information on a great and important subject Both editors and contributors deserve the thanks and the congratulations of the medical world on the conclusion of their labours

THE HAIR AND ITS TROUBLES

Dr O Donovan's treatise on *The Hair*[1] is the most interesting on the subject that has been published for some time He describes the development of the hair and all the curious variations in pattern of growth pigmentation etc which are found and also quotes instances of the rare abnormalities and freaks to which it is subject such as ichthyosis follicularis and monilethrix He has not neglected however the more practical side of the subject The diagnosis and treatment of ringworm alopecia areata and the other conditions commonly brought to the notice of both the general practitioner and the dermatologist are fully discussed in the light of the author's own wide experience Writing on the vexed question of the thallium treatment of ringworm he advises that this should only be used for children too young to be submitted to *x* ray epilation He gives a good summary of the treatment of hypertrichosis with a warning that cannot too often be repeated against the dangers of employing *x* rays for this condition Although the medical profession is now well aware that *x* rays must never be used for the destruction of superfluous hair there is good reason to believe that quacks are still able to persuade a good many women especially in America to submit themselves to the rays in order to rid themselves of this distressing disfigurement Dr O Donovan also has an interesting chapter on hair dyes and dermatitis a matter on which dermatologists are continually being consulted His advice is quite sound but we rather think that he is unnecessarily sweeping in condemning all metallic hair dyes as potentially dangerous On the other hand there is no doubt about the risks to which those who employ the phenylene diamine derivatives are exposed and in consequence hairdressers nowadays habitually test their clients in advance by applying the dye to a small area of the skin over the mastoid process Very properly Dr O'Donovan draws attention to the public health aspect of barbers' shops, and quotes the model regulations for the conduct of hairdressers' saloons in the City of London It is a great pity that such regulations are not in force universally in this country Many barbers shops are a source of great danger The American public health authorities are much in advance of ours in this matter

In conclusion we must add that this is a well written and very readable account of the subject the only criticism we have to make is that here and there it is a little difficult to be certain whether the author is stating his own opinion or quoting that of others There is one curious slip on page 9 where it appears that ultra-violet and polarized light are identical The volume is well printed, and the numerous illustrations are well reproduced and appropriate We commend the book to the profession

"DE MORTUIS"

Dr C MacLaurin who was formerly lecturer on clinical surgery in the University of Sydney publishes under the title *De Mortuis*[2] a series of essays on the conditions, pathological and otherwise, which may have influenced the lives of many persons eminent in history The essays have already met with general approval the first group he called *Post Mortem* It was published in 1923 and has been reissued nine times the second appeared as *Mere Mortals* in 1925 and a second impression was called for within the year It is clear, therefore, that there is a large circle who wish to know more about the personal life and illnesses of historical personages The present volume contains 276 pages, with 12 whole page illustrations but needs an index It is written in a light vein and the style sometimes becomes colloquial It is intended more for the general reader than for the specialist in the history of medicine The author living at a distance from original documents has been obliged to content himself with what others have said—not always correctly—and to draw his conclusions from their statements In many of the essays however, he has elucidated his problems by knowledge drawn from clinical experience as a medical man in hospital and in private practice Throughout the book Dr MacLaurin shows that he has read widely, and he puts his reading to excellent purpose It is notorious that doctors differ but everyone will agree that he is rather hard upon Sir Thomas Browne about whom he says 'I might almost feel justified in saying that *Religio Medici* is generally considered by doctors to be a farrago of quackery mysticism credulity and astrology put into gorgeous and quite unnecessarily obscure language full of sound and fury signifying nothing Probably Browne was unconsciously remembering the teachings of some old lady who had impressed the truth upon him in early infancy probably with her slipper' Of such sentences it can only be said with a sigh *Sic transit gloria mundi*

The net result of Dr MacLaurin's essays is that syphilis and arterio-sclerosis explain many of the tragedies of history He accepts without reserve that Henry VIII acquired syphilis In the light of the latest researches the fact is no longer tenable and if it is untrue the whole story of The tragedy of the Tudors' falls to the ground for Dr MacLaurin attributes the early death of Edward VI to tubercle grafted upon a syphilitic inheritance Mary he thinks died of degeneration of the heart and arteries not necessarily but probably syphilitic and inherited from her father' The difficulties in connexion with the life and actions of Queen Elizabeth he explains by saying that "her endocrine balance was abnormal' without further comment though this does not carry matters very far Ivan the Terrible—a criminal lunatic—was in Dr MacLaurin's opinion a syphilitic and to a spirochaetal infection of the brain the worst of his actions are attributed But his father was at least a borderline" case and Ivan had an imbecile brother Benvenuto Cellini on the other hand is acquitted of having acquired the disease in spite of his own confession to the contrary In considering the illnesses of Mr and Mrs Pepys Dr MacLaurin states correctly that there is no evidence of syphilis but omits to draw the conclusion that Mrs Pepys had an attack of bartholinitis Dr Johnson appears to have been a psychasthenic and his convulsive ties were the result of the unconscious memory of a sensitive little boy shrinking from the ordeal of being touched for the King's Evil by Queen Anne It is all very interesting and may or may not be true The whole book gives food for thought and is well worth reading

NOTES ON BOOKS

FIVE years have passed since the fourth edition of DR LETHEBY TIDY'S *Synopsis of Medicine*[6] was published, thus in the fifth we find much new material and many small changes The result is the production of a thoroughly reliable catalogue of all the diseases within the province of the physician The author makes no claim to erudite literary achievement His aim is to give to students a quick and efficient reference to systematic medicine, and he succeeds admirably

We have received for review the twenty first edition of HARE'S *Text Book of Practical Therapeutics*[7] The popularity of this work is indicated both by the number of editions and by the fact that it is only three years since the twentieth was reviewed in these columns The general form and arrangement of the textbook have been left unaltered, but it has been carefully revised As the author points out in his preface, it is really remarkable how many valuable new methods of treatment appear in the course of a few years For example, the following new methods are described in this edition the use of salvigan, of calcium salts, and of ammonium chloride as diuretics, the treatment of chancroids by tartar emetic, the use of viosterol in rickets and of ventriculin in pernicious anæmia, the separate employment of the oxytocic and vasopressor principles of the posterior lobe of the pituitary These examples also show that the author has taken care to keep abreast of the most recent advances in medical science He claims as his first object the provision of a textbook useful to students and to practitioners, and it is evident that his efforts have met with very general appreciation

Ephedrine and Related Substances[8] by CHEN and SCHMIDT, is No XVII of Medicine Monographs The book summarizes the results of experimental and clinical investigations on this important new drug, and also contains a full bibliography that occupies twenty three pages This important work was discussed in an annotation in our issue of May 10th (p 873), and its appearance now as a separate monograph is very welcome

A little book by Lady WILLISON of Toronto will be of interest to some of our readers It is called the *Golden Treasury of Famous Books*,[9] and is intended to be an encouragement to good reading, and an introduction, especially of boys and girls, to the world of worthy books It should be successful in its object, for it surveys a very wide field and offers a surprisingly varied choice where tastes must necessarily differ so greatly The author seeks to interest young people, not merely in certain famous books, but also in the personalities and lives of their writers, and offers guidance both in the wise choice of tales which are commonly regarded as appealing specially to boys and girls, and also among most of those other literary types which may afford at least equal delight to young people who can be led to understand their form and purpose These are matters not entirely remote from the functions exercised by a family physician in his daily practice, and doctors and patients alike may well find help in Lady Willison's pages

I *German English Technical and Scientific Dictionary*,[10] by A WEBER is much wider in its scope than the title suggests It includes many words which, though not technical in themselves are likely to be met with in technical works and papers, and some whose place in a technical and scientific dictionary seems rather difficult to account for To take a few examples at random, definitions are included of *feier, gram* (meaning grief or aversion), and *Lurz*, and of a good many other words which are adequately defined in the ordinary German English dictionary This tendency to overload dictionaries is to be deplored The English speaking reader of German technical and scientific papers does not need to turn to a dictionary for the meaning of everyday words, and their inclusion only serves to add to his labour in looking up the words he does want In appendixes the author gives a list of atomic weights, specific gravities, melting points, and boiling points of elements, tables of technically and commercially useful abbreviations, signs, and symbols, and a large botanical section of over five thousand references, containing in triple column pages of scientific terms with their English and German equivalents Roman type is used throughout the volume, and the printing, paper, and get up are excellent

In a thesis on the treatment of pernicious anæmia with desiccated hog's stomach[11] Dr J D G DU PREEZ gives an account of the work of Sturges and Isaacs, Connor and others, and records his observations on the application of the treatment in Professor Snapper's clinic at Amsterdam The series studied consisted of eleven patients—seven females and four males—of ages ranging from 31 to 71 all of whom were subjected to the treatment and derived remarkable benefit from it Dr DU PREEZ concludes that the treatment is specially suitable for patients who do not react to liver therapy and has the added advantage that hog's stomach is much cheaper than liver

In his monograph on atrophic rhinitis[12] Dr MONSERET presented in elaborate description of the etiology, symptomatology and complications of this disease This includes the geographical and hereditary background on the one hand and every possible associated condition on the other The book, *however, is really a plea for treatment by potassium iodide* based on the theory that it is associated with varying degrees of thyroid insufficiency, and often with goitre The author seems to have had much success with the method advocated and claims 95 per cent of cures It is curious that in recent years this disease, which formerly was the bane of out patient departments for diseases of the nose and throat has almost disappeared It is now only seldom seen even in a mild form, and patients never present themselves in the repulsive state so common fifteen to twenty years ago The disease therefore has now lost much of its importance in this country but the author seems to find it still frequent in the mountainous districts of France

PREPARATIONS AND APPLIANCES.

FORCEPS FOR HOLDING RADIUM NEEDLES AND RADON SEEDS

DR ROY WARD (Radium Institute, London) writes

Frequent manipulation of radium needles or radon seeds will sooner or later produce inflammatory changes on the fingers and hands of radium workers unless adequate precautions are taken When the gamma rays of radium pass through metal screens or strike metallic surfaces, secondary rays are produced, these rays are of the soft beta type and capable of causing a chronic dermatitis

In order to minimize these risks, forceps covered with bakelite have been designed for this purpose The ends of the needle holding forceps are either T shaped or set at an angle The radon seed holding forceps are made in such a way that a seed once grasped cannot jump out

These instruments are boilable, and have been in use in all departments of the Radium Institute for nearly a year They were made for me by the Genito Urinary Manufacturing Company, Devonshire Street, W 1

SOLUBLE COFFEE POWDER

We have received from the Bantam Products Ltd (Worthy Leeds) a sample tin of Bantam coffee, which has the advantage of being prepared in the simplest possible fashion It is in powder form, all waste grounds have been extracted, so that it dissolves instantly in hot water or milk, and quite *readily in cold* water The manufacturers claim that when a patient is beginning to tire of the routine of milk a small quantity of Bantam coffee makes it much more palatable We found that a test cup was free of the harsh tang too often associated with ordinary coffees, and, moreover, there were no troublesome grounds to dispose of Those who have no time to spend over the correct and satisfactory preparation of coffee on old fashioned lines should welcome this product

THE HEALTH OF LONDON

REPORT FOR 1929

THE report of the county medical officer of health and school medical officer, Dr F N Kay Menzies, records the state of the public health for London during 1929

Births and Deaths

The population of the County of London in the middle of 1929 is estimated by the Registrar-General to have been 4 430,000, including 12,100 non-civilians, there has been a decrease of 37,700 of the civilian population since the middle of 1928 The births were 70,089 equivalent to a birth rate of 15 8 per 1,000 as against 16 2 in 1928, this is the lowest birth rate ever recorded in London the number of births being fewer by 887 than in 1918, when the influence of the European war was at its height The City of London has the lowest birth rate, 7 7, then follows Holborn 10 2, with the City of Westminster very close 10 5 Chelsea has a birth rate of 11 7 At the other end of the scale are Shoreditch, 20 1, Bermondsey, 19 18 Poplar, 19 2, Finsbury, 19 0, and Bethnal Green 18 7 The deaths were 62 889, giving a death rate of 14 2 per 1,000 *compared with 12.1 in 1928 this marked increase* was due to the severe influenza epidemic, associated with an unusually rigorous winter, and in addition, the epidemic prevalence of whooping cough, which was mainly responsible for the rise of the infantile mortality rate from 67 in 1928 to 71 in 1929 For the whole of the county the death rate from whooping-cough was 0 26 per 1,000 of the civil population The highest death rate occurred in Paddington, where it was 0 50, the next in Finsbury with 0 41, in Shoreditch, Islington, and Kensington the rate was 0 40, and in St Pancras it was 0 37, Lewisham and Stoke Newington escaped with a rate of 0 10, and Hackney with 0 11

Although the weather conditions in the year under review were such that an epidemic of infantile diarrhoea might have been anticipated the rise was small compared to the result of such weather conditions in 1911 A closely reasoned review of the apparently high tuberculosis mortality of mental hospital patients shows that considered in the light of the death rate from all causes, the mortality from phthisis in the L C C mental hospitals does not differ materially from that of the general population Fatal street accidents continued to increase in number, the total being 814 in the fifty-two registration weeks of 1929, as against 747 in 1928

Small pox

The mild type of small pox which invaded London during 1928 became established in many parts of the metropolitan area during 1929 no fewer than 1908 cases were notified. The eastern boroughs Stepney (489) Bethnal Green (262) Shoreditch (246) Poplar (158), with Southwark (153) and Camberwell (117), had the largest number of cases, the western boroughs almost escaped, Fulham and Chelsea having none, in the northern area St Marylebone had only three, and Hampstead none

The discovery of cases in the in-patient and out patient departments of hospitals was of frequent occurrence, and led to much dislocation of hospital regime several cases occurred also among employees of large firms and business houses and a number of common lodging houses (especially in Stepney) were affected No vaccinated child under 11 years of age contracted small-pox Nine deaths occurred in cases admitted to the Metropolitan Asylums Board's hospitals The *Tuscania* outbreak of forty five primary cases of virulent small pox causing eight deaths is reviewed, no deaths occurred in London among those who were infected on the ship One fatal case of small pox occurred in Woolwich shortly after this time, possibly connected with small-pox introduced by shipping The fact that the virulent variety of small pox is comparatively seldom introduced into London, and that, even when such cases do occur the disease rarely spreads to any material extent, provides eloquent testimony to the vigilance of the port authorities and to the energetic measures taken by the metropolitan boroughs

Diphtheria

The notified cases of diphtheria numbered 11,788 in the registration year, an attack rate of 2 7 per 1,000, the number of deaths was 350, as opposed to 399 in 1928, making a case mortality for 1929 of 3 per cent During the year immunization clinics were started in the thirteenth and fourteenth boroughs to adopt this procedure, fifteen metropolitan health units have not yet moved in this direction In the aggregate, in metropolitan and Greater London, about 26,000 individuals, the great majority under the age of 15 are now known to be or are being protected against diphtheria by means of the toxoid-antitoxin inoculation

Enteric Fever

A further diminution in the incidence of these diseases is recorded 351 notifications were received in the fifty-two registration weeks, as compared with 580 in 1928 The deaths in the calendar year numbered 45, as against 51 in 1928 A short account is given of the outbreak which occurred during the latter part of September in Lewisham, Beckenham and Penge, there were 124 cases seven being fatal *The evidence strongly suggests that the outbreak* was caused by a "carrier" infecting cooked food (ham) but by the time the probable source of infection was traced this carrier condition had ceased

Acute Rheumatism in Children

Dr Mabel Russell writing on rheumatism as it can be explored by the medical inspector in the schools during special inquiry, states that her figures relating to 632 girls in two Chelsea schools show that roughly one-third of those with a history of "growing pains had clinical signs—that is, degrees of anaemia and myocardial debility —which were possibly due to subacute rheumatism That acute rheumatism in children is simulated by many other diseases is shown from the fact that to the Queen Hospital Clinic children have been sent with lymphatic leukaemia, osteomyelitis traumatic myositis ossificans fracture of the tip of a malleolus an ossifying haematoma round the ankle joint flat-foot cervical rib psoas abscess tonsillar sepsis, pyelitis cystitis and muscular weakness after illness Every medical practitioner will sympathize with the school doctor who sent a child to the rheumatism clinic with one of the following heart conditions which Dr D W Winnicott agrees require close examination congenital heart disease systolic murmurs at the base end of the apex which can be ignored irregularities originating in the sinus and not indicative of disease premature contractions of unknown causes but not rheumatic attacks of paroxysmal tachycardia tachycardia or temporary dilatation or pain in the heart region due to pathological anxiety Cases are seen at rheumatism supervisory clinics at the Hospital for Sick Children Great Ormond Street Royal Waterloo Hospital Queen's Hospital for Children Hackney Elizabeth Bullock Centre and Downham Centre Authorities other than the London County Council have established clinics at Paddington, Kensington, and Marylebone Other centres open now, or to be opened shortly are, or will be at Woolwich, Hammersmith, Putney and at King's College Hospital Special arrangements are made for in-patient treatment at Queen Mary's Hospital Carshalton where there is a set or "unit" of acute cases, and another set of subacute cases At High Wood Hospital, Brentwood, subacute cases are dealt with In doubtful rheumatic cases and in rheumatic cases between attacks in the absence of active carditis the authorities very logically try to get a holiday for each debilitated child when the debility seems to be largely the result of home conditions

Over pressure in School Children

The report bears out the view held generally by school medical workers that while the public elementary school child does not suffer from over-pressure the secondary school child does We hear again the same tale—home work and long-distance travel to school Dr Menzie does not say in so many words that there should be co-ordination among a child's teachers as to the amount of home work

[1] London County Council. Annual Report of the Council 1929 Vol. iii Public Health (including the Reports for the year 1929 of the County Medical Officer of Health and School Medical Officer Main Drainage and Housing). London P S King and Son Ltd. or through any bookseller 1930. No 2731. 2s 6d.

set—nor does he point out that as much as possible all school children should come to school for the day and not for the session "For healthy development children want spaces of free and undisturbed time" (Lord Grey of Fallodon) If this be so a change may be wanted in our great public schools, where we are told by their medical and teaching staffs that almost every minute of the day is filled up

Chronic Invalidity among School Children

A valuable measure of the morbidity of the children of the nation is provided by the chronic invalidity returns relating to school children The school attendance department reports each month the names of all children who have been absent from school entirely on account of health for three months and upwards Each year the number of sick children remaining on the list in the month of November is analysed The numbers remain constant 1929, 2,210, 1928, 2,200, 1927, 2,006 1926, 2,239 Rheumatism and associated conditions, including heart disease, account for 30 8 per cent

Mental Deficiency Acts, 1913–27

At the end of the year the Council was dealing with 5,560 cases Of 841 alleged mental defectives medically examined, 342 were over 16 years of age some of these latter were children leaving special schools for the mental defective as cases to be considered by the Education Committee with a view to notification relative to supervision, guardianship, or institutional care The numbers of individuals over 16 years of age otherwise dealt with is apparently not given One person (over 16 years of age) out of the 841 was found to be a moral defective, sixty were found not to be mentally defective Eight occupation centres are provided by the London Association for Mental Welfare and the Central Association for children unable to benefit by the education provided at the special schools for the mentally defective altogether 154 of these children were medically inspected by the school doctors during last year from the comparative figures and other information given they seem to have better teeth than the ordinary school children, but more discharging ears, more deformities, and more squints The L C C has made a grant towards the cost of employment of guides where necessary to convoy children to and from the centre

Other valuable items in Chapter II of the report include an analysis of the causes of death and premature retirements for ill-health during the ordinary working period of a teachership occurring among the teaching staff, made by Dr Letitia Fairfield More or less untimely deaths occur in one man teacher in 244, but less in women, one in 317 but while only one man in 525 breaks down, in women the figure is one in 194

Nursing Homes Registration Act, 1927

At the end of the year there were 278 premises on the register of nursing homes, apparently, in addition, there are 118 other premises which are not conducted for profit, and which are exempted for periods of a year from the provisions of the Act by the Council A number of premises are being used for the accommodation of certified mental patients Such premises are under regular supervision by officers of the Board of Control, and, in order to avoid unnecessary dual inspections of such premises, it was decided that, provided that the premises used for the accommodation of patients in "single care" were not used for the accommodation of any other type of patient, it would be unnecessary for owners of such premises to make application for the registration of their premises as nursing homes Arrangements have been made to keep the Board of Control informed of all premises throughout London which appear to be used for the accommodation of mental cases whether certified or not The new by-laws issued by the London County Council were approved on March 1st 1929 One keeper was prosecuted successfully for failure to exhibit the certificate of registration in a conspicuous position, and also in respect of obstruction of the Council's inspector in the execution of his duties under the Act In London three part-time assistant medical officers carry out the work of inspection and reinspection of premises used as general nursing homes, the premises used mainly for the reception of maternity patients are inspected by the assistant medical officers who superintend the midwives Inquiries with regard to unregistered premises suspected as being used as nursing homes are carried out by inspectors attached to the department these inspectors, who are qualified sanitary inspectors, also inspect all premises in respect of which applications are received for registration as nursing homes with a view to obtaining detailed information as to the sanitary conditions and the general maintenance of the premises

Sanitary Administration

The systematic examination of the water in the Thames by the chemical staff of the L C C showed that the "drought" experienced more or less during the first nine months of 1929 had a prejudicial effect on the condition of the water, especially in the vicinity of the sewage outfall Here as much as 60 per cent of the water at high tide is sea water This figure indicates how much the removal of sewage effluent from the river is retarded during seasons of drought Fortunately the L C C has now embarked upon a policy of installing successive purification units In out door swimming baths not filtered with a filtration plant much difficulty was experienced in keeping the water in good condition, the loss of transparency is due not only to soiling of the water, but also to the separation of calcium carbonate as the result of photosynthesis It is no easy task to destroy green growths by chemicals In addition to the experiments with the modified two-tier channels for the treatment of sewage with activated sludge, some work has been done on digestion of ordinary sewage sludge such as is sent to sea It was found that the behaviour, on digestion, of sludge from the Council's works was similar to that observed at other places in this country and in Germany and the United States of America After a rather long preliminary period gas formation began, and although not at first combustible, the gas, after a time, contained a larger proportion of combustible constituents, the calorific value of the gas obtained during this period being about 750 British thermal units per cubic foot The production of carbon dioxide during the early stages of digestion can be greatly reduced by the addition of air slaked lime to the fresh sludge The production of gas goes down to inappreciable amounts in cold weather During the acid stage of digestion much separation of solid matter takes place, but as the solid matter cannot be relied upon either to settle to the bottom or to rise to the surface no practical means of de-watering has yet been based on these observations These experiments were on a very small scale, but the results are sufficiently promising to show the desirability of further investigations on a works scale

In addition to the maintenance of deposit gauges in six open spaces in the county, observations of visibility have been made Examination of the horizontal range of visibility to the fog shade indicated on Owen's recording filter shows that the mean monthly distance of the farthest visible objects falls off rapidly until a mean monthly fog shade of 1 (=0 02 mg suspended carbon per cubic metre) is reached when the limit of visibility is about a mile Greater amounts of soot have a lessened effect on visibility, and it is clear that some such point must be reached, since the possible range becomes very small and there are degrees of invisibility A real but less marked correlation was observed between the total deposit collected in a gauge near the County Hall and the sulphate in that deposit and the visibility in the direction of the gauge

Housing

Dr Menzies considers that the first step to be taken to diminish the unsatisfactory housing conditions in London is the comparatively inexpensive one of closing basement rooms "Without any question certain underground dwellings in London are the most insanitary houses to be found in the metropolis The most insanitary areas do not, and never have provided such intense degrees of insanitariness as are to be found in the case of the underground rooms under consideration" There are about 30,000 basement dwellings in London which are considered unfit for human occupation, not all of them separately occupied, they are housing some 100,000 persons

British Medical Journal.

SATURDAY, DECEMBER 6TH, 1930

THE USES OF RADIUM IN SURGERY

In his recent broadcast talk on The future of surgery Lord Moynihan remarked that surgery had taken radium into partnership The remark is significant as indicating the attitude of the titular head of the surgical profession towards a method of treatment which until a comparatively recent date was regarded as the special province of the radiologist a method moreover which had but little part in dealing with those forms of disease in any degree amenable to surgery During the last eight years the surgical standpoint has shifted until at the present time surgeons have definitely abandoned more than one operation in favour of radium treatment being satisfied that the selective powers of radium can do what cannot be achieved by the unselective scalpel But even eight years is a brief period in which to establish precisely the best methods of applying the newer forms of radium treatment and to assess accurately their curative value in relation to that of surgical operations

Radium technique is still changing year by year in its detail as evidence accumulates, and the workers in the different clinics where radium is at all extensively used must frequently meet to exchange ideas and experiences and to present to the world their interim reports on the results obtained Of great value therefore is the series of papers printed in this issue of the *British Medical Journal* containing communications made to the Surgical Section of the British Medical Association under the presidency of Lord Moynihan at the Winnipeg Meeting The subject under discussion was primarily the radium treatment of malignant disease and the greater part of this field of investigation was well covered by surgeons who are acknowledged experts in their particular branches of radio-surgery It is obvious that radium implantation can never be expected to perform the miracle of controlling malignant disease which has progressed beyond the stage of localization in accessible parts of the body so that many patients will not be cured although the outward and visible signs of disease have disappeared This unavoidable limitation is partly responsible for the wave of disillusionment which is clouding the estimation of the value of radium in the popular mind at the present time Mass opinion always prone to rush from one extreme to the other acclaimed radium a year ago with exaggerated hopes the cold douches recently administered in pronouncements emanating from the Radium Commission have been a wholesome corrective but it is probable that these have for the time being pushed mass opinion too far in the other direction Meanwhile the medical profession must soberly examine the evidence laid before it, and await the final verdict which only time can give

Radium treatment has unquestionably achieved its highest successes in dealing with carcinoma in the buccal cavity reported upon by Dr Douglas Quick, Mr Stanford Cade, and Dr Birkett and with carcinoma of the cervix In these two regions the mutilating operations formerly practised have been virtually abolished This is a great step forward even though final mortality rates may not have been materially altered In the case of carcinoma of the cervix, progress is still limited by the difficulty of irradiating the lymphatic extension of the disease in the pelvis In buccal carcinoma where the primary disease has proved remarkably amenable the lymphatic extensions, under the jaw and in the neck are accessible, but have so far for no very obvious reason not been easily controlled by irradiation Dr Birkett even goes so far as to advocate two methods of approach neither of which calls for the use of radium If no enlarged glands can be felt he believes that no treatment of the neck should be undertaken If at any stage enlarged glands are present then he asks a surgeon to carry out a very extensive dissection of the neck Dr Quick and Mr Cade on the other hand advocate treatment in every case by x ray therapy or with the radium bomb or by the use of radium either by blind needling as prophylactic treatment or by needling after exposure of the glands where they are enlarged Where practices are so divergent as these clearly no settled opinion can be expected for some time to come, but in the meantime the sufferers may at least be allowed to keep their tongues In treating carcinoma of the rectum Sir Charles Gordon Watson is still unable to recommend radium treatment when operation is possible owing to the uncertainty of its effect Radium is therefore chiefly reserved for those patients in whom an inoperable lesion may be made operable and for the palliation of very advanced disease An exception however is made in favour of radium for squamous-celled carcinoma of the anal margin Here the results have been almost uniformly satisfactory Some novelty was introduced into the discussion by the reports upon radium in genito-urinary disease presented by Mr Frank Kidd and Mr Clifford Morson It appears that in treating carcinoma of the bladder results are still very indefinite and in certain cases Mr Kidd has found that the disease was accelerated by the treatment so that he ends his report on a note of warning Mr Morson on the other hand was able to report very satisfactory results in treating carcinoma of the penis and it is likely that here another mutilating operation is about to be abolished

As the success of radium treatment of cancer clearly depends to a large degree upon the accessibility of the possible lymphatic extensions it might reasonably be expected that carcinoma of the breast at any rate in its earlier stages would be particularly open to attack It is therefore the more to be regretted that exigencies of time and space did not allow of the presence of anyone at the meeting who could speak with authority on the radium treatment of this region of the body such as has been in progress for some years at St Bartholomew's Hospital and elsewhere The whole discussion at Winnipeg avoided any undue show of enthusiasm for radium treatment but it demonstrated that solid advances have been made and that further advances may be looked for in the future

SCIENTIFIC HONOURS

RATHER more than a year ago we recorded the award of the Nobel Prize for Medicine to Professor Eijkman and Professor Sir Frederick Hopkins. A few weeks ago Professor Eijkman died. In him the world, as well as Holland, has lost one of the pioneers of modern science, and his countrymen will certainly have the sympathy of his fellow workers in every land. The Nobel Prize is one of the very few scientific honours that carry with them substantial material reward, unmixed with heavy duties and responsibilities. It is said that, coming to him as it did at the end of an active life, Eijkman should have had only so brief a period to enjoy his success. To Eijkman's colleague, Sir Frederick Hopkins, has fallen yet another honour, that of the Presidentship of the Royal Society. If the Nobel Prize is the greatest international honour to which a scientific man can aspire, that of President of the Royal Society is perhaps the greatest that (if he be an Englishman) his countrymen can bestow upon him. A glance at the list of past Presidents of the Royal Society is sufficient assurance that he who fills that office adds his name to a roll which, stretching back into the seventeenth century, includes a group of scientific men, whose collective achievement overshadows that of which any other country can boast. There have been forty-two presidents since 1663. For the first century or so, the choice was by no means confined to men of science, for in the list the first dozen names include those of Sir Christopher Wren and Samuel Pepys, as well as Sir Isaac Newton. Sir Frederick Hopkins is the seventh medical man to fill the office.

It is a source of great satisfaction to the medical profession that it can claim Sir Frederick Hopkins as a member. His path has always followed the lines of pure research, yet his sympathy with, and interest in, the practice of medicine has always been prominent, and much of his work has had a direct medical bearing. On the occasion of the award of the Nobel Prize, we made mention of some of the most outstanding of his contributions to science, and perhaps there is no need to recapitulate on this occasion. Suffice it to say that he is still a most active worker. As a teacher, his name stands among the first of the Cambridge school. His "Part II" lectures—those dealing with the more advanced, as opposed to the elementary, aspects of his subject—have a unique quality of freshness and inspiration. He has the power, to a remarkable degree, of making his hearers feel that there is always more to be done, and, above all, that it is well-worth the doing. Medicine need have no doubt that the Presidentship lately held by such a distinguished physicist as Sir Ernest Rutherford, will be worthily filled by its present occupier.

For those interested in any aspect of biology, Sir Frederick Hopkins's election is an important event, but one cannot avoid noticing the extreme apathy shown by the public at large towards scientific affairs. To the award of the Nobel Prize last year even newspapers which would scorn the epithet "popular" devoted but a few scanty and rather inaccurate paragraphs. In Germany (and it happened that none of the recipients were of German nationality) several important newspapers gave the event a prominence that here would be vouchsafed only to an actress or a hockey. Even in France, some considerable space was devoted to the matter, while, naturally, in Sweden the papers for a few days contained little else. As a matter of fact, English science has, in the past, got along very well without popular support. The time has come, however, when it has assumed tremendous national importance, and it is surely not that the public should take a little interest in its progress, and in the honours bestowed on those to whom it owes its advance.

THE METHYLATED SPIRITS REGULATIONS, 1930

THE Commissioners of Customs and Excise have recently made new Methylated Spirits Regulations which will come into force on January 1st next. The general principle on which the Regulations are based would appear to be to permit the use of ordinary spirit free of all duty for any scientific or trade purpose whatever, provided that the revenue is adequately safeguarded against the use of duty free spirit as a beverage or in the manufacture of perfumes. As a study in intricacy the Regulations are worthy of investigation, but for ordinary purposes this is unnecessary, as the Commissioners have thoughtfully issued three explanatory notices drawn up in terms of comparative simplicity.

In future, methylated spirits will be available in four forms: (1) mineralized methylated spirit, coloured blue, (2) industrial methylated spirits, colourless, (3) industrial methylated spirits (pyridinized), also colourless, and (4) power methylated spirits coloured red. Of these only the second—industrial methylated spirits—is of special interest to medical men, this will consist of 95 parts of ethyl alcohol denatured with 5 parts of wood naphtha, and may be obtained in various strengths, including a strength corresponding to that of absolute alcohol. It may be obtained by any medical practitioner, dentist, veterinary surgeon, hospital, or nursing home, in quantities not exceeding half a gallon at one time, from any wholesale chemist or dispensing chemist who is authorized to sell it, merely on a written order signed by a medical practitioner, dentist, or veterinary surgeon. Hospitals and nursing homes should arrange for a doctor, to whom they are known, to sign orders for them. This provision will satisfactorily meet all the ordinary requirements of the medical profession, but larger amounts may be obtained, where desired, by making application to the nearest officer of Customs and Excise for a formal authorization to receive industrial methylated spirits, which will enable the holder to buy unlimited amounts on requisition on an official form. Industrial spirits received in either of these ways may be used in making up articles to be dispensed for medical, surgical, dental, or veterinary purposes, or may be used or dispensed without admixture or diluted with water for any medical, surgical, dental, veterinary, or scientific purpose. The only material restrictive conditions are that bottles dispensed to a patient containing industrial spirits or articles made from them must be labelled "for external use only," or "not to be taken," or words to the same effect, and that no greater quantity than one pint of industrial spirits alone or as an ingredient may be dispensed to any person at one time.

All the requirements of the medical profession are thus met with a minimum of official safeguards, and for this thanks are due to the Commissioners of Customs and Excise, who have readily accommodated themselves to the points raised by representatives of the British Medical Association at conferences of interested bodies.

THE TERCENTENARY OF QUININE.

IN 1630 one Camzares, a Spanish magistrate in Ecuador discovered the efficacy in fevers of the bark of what was known as the 'fever tree," actually trees of the quinine-yielding species indigenous to South America He recommended the bark to the Countess of Chinchon, wife of the Viceroy of Peru This lady was cured at Lima of a fever by the administration of the bark, and more than a century later Linnaeus named the genus "cinchona" in memory of the countess (He was misinformed as to the spelling of her name and omitted the first "h") When the countess returned to Spain in 1640 she brought with her a supply of the bark, and the valuable properties of the countess's powder," as it was called became known in Europe Quantities of the bark were also sent from Peru to Spain by the Jesuit fathers, and when distributed by their European brethren it was known as the 'Jesuit's powder' In England Charles II was cured of a fever by the application of the bark and knighted Robert Talbor author of *Talbor's wonderful Secret for curing Agues and Fevers* who brought it to his notice A more scientific knowledge on the subject of these rubiaceous trees and their distribution was forthcoming in the latter half of the eighteenth and the first half of the nineteenth centuries when various French and Spanish expeditions visited the forests of the Andes In the middle of the nineteenth century efforts at transplantation were made, and eventually cinchona was successfully introduced into India where now between 3 000 and 4,000 acres are under cinchona yielding about 40,000 lb of quinine every year Of the many species in the genus only three are worthy of consideration from the medical point of view, and of the twenty or more alkaloids obtainable from the barks, only five have much medical interest The discovery of quinine and its application is altogether a romantic story, about which a book might well be written, telling of the pioneer explorations of the venturesome Spaniards in South America, and, not less thrilling the research expeditions of later scientific investigators The Wellcome Historical Medical Museum in Wigmore Street, London is celebrating the tercentenary in a very interesting manner An extensive collection of exhibits has been arranged to illustrate the history of this most valuable discovery in materia medica The exhibition is designed to bring out the historical development from the time of the first introduction of the bark until the present day when experimental research on its active principles is still continuing There are also to be held four receptions at the Museum on the afternoons and evenings of December 8th and 10th On the first afternoon under the chairmanship of His Eminence Cardinal Bourne an address is to be delivered by the Spanish Ambassador, and it is hoped that the French Ambassador and the Peruvian Minister will also speak In the evening under the presidency of the Netherlands Minister an address will be given by Archbishop Goodier and other speakers will be the American Ambassador and Professor Van der Wielen of Amsterdam University On December 10th Dr H S Wellcome himself will preside at the afternoon gathering when the principal address will be delivered by Sir David Prain who has had much to do with the development of the Indian cinchona plantations The final reception, on the evening of the 10th will be of a medical character Sir John Rose Bradford President of the Royal College of Physicians is to preside and the principal address will be delivered by Sir Humphry Rolleston Regius Professor of Physic in the University of Cambridge other speakers being Mr A R Melhuish, President of the Pharmaceutical Society and Colonel C T Samman, Master of the Society of Apothecaries

CINCHONA FEBRIFUGE.

THE cost of drugs is a matter of no small moment in the successful treatment of diseases endemic among poverty-stricken tropical populations, and this is particularly true of the treatment of malaria Italian experience has shown that a low standard of living may in itself be a prominent factor in increasing susceptibility to malaria, hence it is idle to recommend the use of an expensive drug to a population whose poverty favours the incidence of the disease For this reason cinchona febrifuge is an important remedy in tropical countries Salts of quinine have many advantages over cinchona febrifuge for the treatment of white populations, but unfortunately they are expensive, for example, a recent wholesale price quoted for quinine sulphate is 2s 3d an ounce and at this rate the alkaloid costs about twice its weight of silver The whole sale cost of the drug used in the treatment of a case of malaria of average severity is between 6d and 1s Not a large sum perhaps, but in this country if quinine were needed in large quantities to combat malaria the drug allowance under the National Health Insurance scheme would have to be increased In tropical countries the cost of quinine is an important factor limiting its use Cinchona febrifuge has two advantages, it costs less to prepare than quinine salts and all the alkaloids in cinchona bark are utilized The latter is a point of much consequence for India because the *C. succirubra* is a hardy tree that gives a heavy yield of bark with mixed alkaloids, and is therefore suitable for providing a large yield of cinchona febrifuge at a low price, whereas the varieties of *C. ledgeriana* which have been evolved by selective breeding to produce a high quinine content are more delicate trees There are really two problems involved first the relative value of quinine and the other alkaloids of cinchona bark in the treatment of malaria and secondly whether it is possible to prepare a cinchona febrifuge of uniform composition The latter problem is very important for the first requirement of successful therapy is the possession of a drug of uniform potency Papers recently published from the Wellcome Research Laboratories give information on both these points The action of the cinchona alkaloids has been tested systematically on bird malaria [1] The author found that hydroquinine was the most active followed by quinidine, quinine cinchonidine and cinchonine in descending order but the differences between the last four were slight Previous clinical investigations have borne out the chief conclusion—namely that there is only a small difference in the therapeutic activity of the four last-mentioned alkaloid This conclusion is of great practical interest because it suggests that the separation of quinine from the other three alkaloids is wasteful from the economic standpoint Analyses of cinchona febrifuge how however that at present the composition of this preparation varies in an extraordinary manner The authors have detected a number of errors in previous methods used to isolate the individual alkaloids but their corrections only accentuate the variations in the composition of the total alkaloids present in different samples The proportion of quinine in the three specimens was 15·6 1·8 and 5·5 per cent respectively whilst the crystallizable alkaloid varied from 2·5 to 5·2 per cent These figures confirm the conclusions of previous workers who have shown that there is no uniformity in the composition of cinchona febrifuge Apparently cinchona febrifuge represents the residue left behind after the alkaloids of chief commercial value have been removed and the proportion removed depends on a number of variable factors chief among which is the price of quinine The preparation of a cheaper but efficient

substitute for pure quinine is certainly a matter of importance to the British Empire, cinchona febrifuge is at present the only likely substitute It is used already on a large scale in India, and it would appear practicable to employ it on a much larger scale both in India and in some of our tropical colonies The preparation of a cinchona febrifuge of rigidly uniform composition would be difficult, if not impossible, owing to the variations in the alkaloidal content of cinchona bark There is, however, no adequate reason for the extreme variations that occur at present If the use of cinchona febrifuge is to be extended widely, it is obvious that some means of standardization must be devised which will ensure that the preparation has a much more uniform composition

A MEDICAL SUNDAY SCHOOL IN PARIS

Leçons du Dimanche was reviewed in our columns on May 4th, 1929 (p 822), on its first appearance last year, and the second (1930) series of lectures[1] is very welcome It is particularly interesting to us because it serves as a mirror of current medical interests in France, and we can see the subjects which so attract the general practitioner of Paris that he is willing to spend eleven of his Sunday mornings at the Hotel-Dieu The lectures cover a wide field of physiology, pathology, medicine, surgery, and therapeutics It is impossible to review each lecture, but a few of them may be mentioned here Carnot, the editor of the series, begins them with a most interesting account of the substances, mineral and humoral, which induce cell proliferation in the animal body One set of experiments shows how the injection of serums from animals repeatedly bled aids in blood regeneration in human cases of anaemia, and may have important therapeutic bearings, which, although tested in France, have attracted little attention in England Binet gives a summary of his now well-known work on the functions of the spleen, which is important in relation to Barcroft's work in Cambridge Villaret's lecture on the use of acetyl choline in the treatment of Raynaud's disease, obliterative arteritis, and kindred conditions, is perhaps the most interesting of all Villaret, though he makes no claims to earlier work on the physiological properties of this substance, states that he is the originator of its use in practical clinical medicine He not only gives a full account of the drug and its action, but goes most carefully into the practical difficulties of its administration and particularly of its dosage and frequency of repetition under different circumstances We look forward to the annual appearance of these most interesting lessons"

THE LEEDS MATERNITY HOSPITAL

SOME account was given in the *British Medical Journal* of August 1921 (p 249), of the development of the teaching of midwifery in connexion with the Leeds School of Medicine where it was pointed out that many years ago the students had to depend on Poor Law officers and on private practitioners for their midwifery experience Reference was also made to the fact that in 1885 the Leeds General Infirmary—ever anxious to co-operate with the School of Medicine—started an extern maternity department which was later supplemented by a small intern department at the Hospital for Women and Children At the time of its institution the Leeds Maternity Hospital had only sixteen beds, and was little more than a nursing home The accommodation soon became too limited, and the trustees were fortunate in enlisting the sympathy of Mr J J Pepper, who handed over to them his house in Hyde Terrace—the nucleus of the present hospital In 1910, by reconstruction and by building a new wing accommodation was secured for thirty-three patients and for a nursing staff of twenty-seven During the first year after the reconstruction of the hospital, 398 confinements took place within its walls Other activities included the foundation and development of various centres concerned with the care of women during their confinements at their own homes This work was done with the complete approval of the Infirmary authorities, and on the understanding that the whole of their extern maternity department would in time be taken over by the new hospital In 1914 the hospital was recognized by the Local Government Board and by the Leeds City Council, and received substantial grants from both of these bodies A further enlargement was carried out in 1918, and some adjoining property was secured in order to provide a home for the nursing staff, the accommodation for patients having increased to seventy-five beds In recent years there has been complete co-operation between the Maternity Hospital, the University of Leeds, and the General Infirmary at which the students do most of their clinical work and avail themselves of its facilities for obtaining experience in midwifery As a result, the entire teaching of obstetrics, apart from the lectures at the School of Medicine, has been confidently entrusted to the Maternity Hospital This co-operation and identification of interests is illustrated by the fact that the tutor in obstetrics and gynaecology, who is appointed by the University to supervise the instruction of the students, does most of his work within the hospital In 1923, however, it had to be recognized that, in spite of all that had been done in Leeds and elsewhere in the country, the maternal death rate was as high as it had been a quarter of a century before, and the board of management boldly decided to extend the hospital on such a scale as to include (*a*) a new ante-natal department (*b*) a new labour ward, (*c*) a new operating theatre and anaesthetic room, (*d*) increased accommodation for lying-in patients to a total number of 108 beds, (*e*) new kitchens, dining rooms, etc , (*f*) improved laundry accommodation, and extended accommodation for the staff It also considered that there was a great need for an isolation block, and that facilities should be secured for research The sum estimated to carry out all these requirements, involving a considerable extension of the hospital, was about £64,000, of which £56,000 was received by October 31st The success of the appeal owed much to the ladies of Leeds, especially to those on the board of management, who showed a remarkable vigour and versatility in the collection of funds The extended hospital was formally opened by Mrs Stanley Baldwin on November 25th, and is now in full occupation The internal arrangements of the building are excellent in every way, and Leeds is to be congratulated in possessing a first-class maternity hospital, well equipped as a charity and as a teaching institution for medical students, nurses, and for those who desire, by post graduate study, to extend their knowledge of obstetrics As a part of their training in this subject the students of the University have to give evidence that they have devoted three months to work exclusively in connexion with the Maternity Hospital They live in an adjoining University hostel, and can be called upon at any hour, so that they have every opportunity of assisting at all kinds of normal and abnormal labours, and of taking part in the ante natal work, which is increasing in importance To meet requests for post-graduate instruction, and to provide qualified practitioners with opportunities for gaining additional experience, arrangements have been made for the accommodation at the hostel of a limited number of post graduate students and of those desiring to specialize in obstetrics

ORIGIN OF THE AUTOMATIC MICROTOME.

As various erroneous accounts of the invention of this instrument which was such an important technical advance in histological methods have gained publicity Sir Richard Threlfall[1] has now recorded the history as it occurred at Cambridge since 1882 In that year W H Caldwell when working at embryology by the method of embedding in paraffin and cutting sections as was the then best available method noticed that if the paraffin was of the right consistency in relation to the temperature, the section adhered to the sharp edge of the razor, and further that a second section cut without moving the first welded itself to the first and pushed it away and similarly with a third and others so that the new familiar ribbon was formed Caldwell communicated this to Threlfall and they agreed that a sectional cutting machine might thus be elaborated Threlfall who generously ascribes the inspiration mainly to Caldwell, then worked out the mechanical details of the machine, which was completed in 1883 and worked admirably the original model being used though with some modification, up to at least 1898 in the laboratory of comparative anatomy at Cambridge The late Sir Horace Darwin of the Cambridge Scientific Instrument Company subsequently brought out the rocking microtome which was a simpler machine than the original model An account of the method for fixing the section and dissolving the paraffin is given and Sir Richard Threlfall describes a remarkable instance of what may politely be called plagiarism He communicated to a demonstrator in comparative anatomy at Strasbourg whose name he has charitably forgotten" the details of the construction of the microtome and the method of section mounting and received rather a shock when towards the end of my stay in Strasbourg I found that this man had written a paper in which he published all the information I had given him under his own name and without any reference whatever to the source from which it had been acquired No doubt a claim will be put in some day for this invention to the credit of the person in question or it may have been made already At all events several German instrument makers began to make automatic microtomes very shortly afterwards each of them of different design"

GINGER PARALYSIS

An epidemic of paralysis involving thousands of cases is reported to have occurred in the United States as a result of drinking adulterated ginger wine Some years ago the Prohibition Bureau decided that the U S A *Pharmacopoeia* fluid extract of ginger was a non-potable beverage The preparation contains some 80 per cent of alcohol and this decision removed all restrictions from its sale Thenceforward the inhabitants of a large area in Ohio and Tennessee acquired the habit of using the extract as a substitute for whisky For some years no harmful results were observed but an epidemic of paralysis suddenly commenced in February this year it reached its peak in March and declined in April having attacked hundreds if not thousands of persons The clinical picture is that of a lower motor neurone paralysis of the distal muscles of the limbs Foot-drop and wrist-drop are two of the most obvious symptoms *Popular rumour incriminated* the fluid extract of ginger and this belief has been confirmed by the investigations of Smith and Elvove Apparently the damage was done by one large consignment of adulterated ginger Samples of this produced paralysis in rabbits and calves but not in monkeys and dogs The investigators believe that the toxic principle is a cresolphosphoric acid ester The direct and indirect complications produced by prohibition have been numerous and varied but ginger paralysis is one of the most curious that has yet been recorded

A BIBLIOGRAPHY OF FOOD INVESTIGATION

THE *Department of Scientific and Industrial Research* has performed a considerable service in issuing an *Index to the Literature of Food Investigation*[1] of which the first and second numbers of the second volume have been published this year It is a commonplace that modern conditions of life have imposed upon civilization many artificial conditions of food supply not the least important of which is the extensive use of tinned and preserved foods of all descriptions On the whole, of course, such methods are of immense economic value to mankind but they bring with them certain potential dangers, for which it is within the province of the medical profession to watch and against which it is its duty to guard the public Investigation of the deleterious effects upon food of various methods of preservation naturally falls within the purview of the manufacturer himself and of various public bodies which are set up to assist him But the medical man must from time to time be faced either with practical problems or with requests for information dealing with such matters and it will be of the greatest assistance to him to know that there exists such an index as that under consideration, by means of which he can easily and rapidly track down the information he desires

THE Medical Research Council is issuing to-day the eighth of its series of reports summarizing the results of research work in the treatment of malignant disease which has been done during the past year with radium salt entrusted by the Government to the Council (Special Report Series No 150 H M Stationery Office 9d net) This stock of radium is distributed on loan among the various centres participating in a scheme of research work under the general supervision of the Radiology Committee appointed jointly by the British Empire Cancer Campaign and the Medical Research Council We hope to publish an account of this latest summary of reports from research centres for 1929 on the medical uses of radium

UNDER the provisions of the Mental Treatment Act 1930 the Board of Control will be reconstituted as from January 1st 1931 to consist of the chairman and four other senior Commissioners Mr L G Brock chairman of the present Board will be chairman of the Board as reconstituted The King has approved the appointment of the following to be members of the Board Mr C J F Macleod K C on the recommendation of the Lord Chancellor and Sir C Hubert Bond M D Dr Arthur Rotherham and Mrs Ellen Pinsent, on the recommendation of the Minister of Health

THE *Lancet* is setting up a commission of inquiry into conditions of service in the nursing profession with special reference to the recruitment of suitable student nurses We are sure that the medical profession will welcome an investigation of nursing conditions and of the reasons for a decline in the number of entrants and as our contemporary has made such inquiries in former years it seems fitting that it should do so again The chairman of the commission is Lord Crawford and Balcarres

THE ROYAL SOCIETY.

ANNIVERSARY MEETING

THE 263th annual meeting of the Royal Society was held on December 1st, St Andrew's Day falling this year on a Sunday The outgoing President, SIR ERNEST RUTHERFORD, O M , was in the chair, and delivered the usual anniversary address, in the course of which he mentioned the fourteen Fellows who had died during the year, and stated the grounds for the award of the Society's medals He also reviewed briefly some aspects of the history of the Society since the war, and showed how its responsibilities and work had increased during that period, referring in particular to the use made of the benefactions received from Sir Alfred Yarrow, and the late Miss Lucy Foulerton, Dr Rudolph Messel, and Dr Ludwig Mond The Foulerton bequest was made specifically for promotion of research in the medical sciences, the late Professor E H Starling was the first Foulerton professor, Professor A V Hill the second, and Dr E D Adrian succeeded Professor Starling In addition to the six professorships supported from trust funds obtained since the war, the Society now offers for the encouragement of young workers eight studentships and fellowships The funds held in trust by the Society for furtherance of research in various branches of science now amount to more than £600,000

The newly elected President, SIR FREDERICK G HOPKINS, D Sc , F R C P , Professor of Biochemistry in the University of Cambridge, took the chair at the anniversary dinner held in Lincoln's Inn Hall on the evening of the same day, with the Prince of Wales as the guest of honour

Dawson Williams Bequest

The report of the Council for 1930 recorded that Sir Dawson Williams for many years Editor of the *British Medical Journal* had left his residuary personal estate, subject to two life interests, to the Society for its general purposes These life interests having now ceased, the Society would benefit to the extent of approximately £8,000

Research Appointments

Among the research professorships and appointments made during the year have been the Smithson Fellowship, awarded to Dr P D F Murray, for researches in experimental embryology the Foulerton Studentship to Dr A S Parkes, for research on the physiology of reproduction, a Moseley Studentship to Mr G S Adair, for research on the proteins of blood, the Lawrence Studentship to Lieut Colonel E C G Maddock for research on tuberculosis, and the Tyndall Mining Studentship to Mr A G R Whitehouse, for research on the loss of salts from the body in sweating, and the passage of water through the skin with and without sweating

Research into Tropical Diseases

The investigation on the bacterial complications of filariasis and on the nephritis believed to be endemic in British Guiana having been brought to a conclusion, the Tropical Diseases Committee with the aid of the Anonymous Bequest Fund, has instituted a research into kala azar in Mediterranean countries With the consent of the Hebrew University of Jerusalem Dr Saul Adler has been placed in charge of the investigation which will be spread over two periods of six months each The Italian Government has afforded facilities for certain stages of the work to be carried out at Catania, and from communications already received from Dr Adler, the investigation would appear to be making satisfactory progress

Cost of Publications

As a result of careful examination of the costs of printing the Society's publications the Council has decided to raise the selling price by 50 per cent This increase will meet only part of the rise in costs since 1914 but it is anticipated that with reduced dimensions the demands on the Messel Mond Funds to meet the annual deficit on publications will be reduced to small dimensions It is hoped that a further economy may be effected by a careful revision of the 'exchange' list

IMPERIAL CANCER RESEARCH FUND

REPORT FOR 1929-30

IN the twenty-eighth annual report of the Imperial Cancer Research Fund, just published, the work of the year 1929-30 is reviewed.

The report deals with some of the most controversial problems of the nature and causation of cancer Many of these have only been clearly formulated by a study of the experimental and naturally occurring tumours of animals While it is possible to deal with certain of the questions of the origin of cancer by a study of the disease in man, the long duration of life in the human species limits the possibilities of successful attack and makes new extended observations inordinately expensive Hence in every country where cancer is studied systematically, organizations and institutes on the same model as that of the Imperial Fund have been set up to acquire new knowledge by study on short-lived animals in order to economize time and money When it is further realized that the whole group of tumours which can be transmitted specifically without the intervention of living cells can only be studied at the present in the domestic fowl, it is clear that the restriction of the main endeavours of the Imperial Cancer Research Fund to the experimental study of cancer under laboratory conditions is imperative both on scientific and on financial grounds One of the most discouraging features of the world-wide activity in cancer research during the last ten years has been the publication of new methods of treatment which have not fulfilled the expectations of their authors and of sufferers from the disease Those responsible for the work of the Fund believe that a more extended and critical use of the methods and material made available by experimental cancer research, before advancing to the crucial, time-consuming experiments on man, would not only be the means of avoiding much unnecessary human suffering, but would accelerate progress which, in a subject of such difficulty and subtlety, is of necessity painfully slow It has been the practice of the Fund to welcome collaboration with workers in other laboratories The lists of workers and institutes to whom have been supplied material and from whom assistance has been given indicate the extent to which this policy is carried out by the scientific staff

DIRECTOR'S REPORT

The director, Dr J A Murray, F R S , in reviewing the work of the year, states that the staff has been chiefly occupied in the preparation of the ninth scientific report shortly to be published, which includes sixteen papers and communications by the research workers engaged The other papers issued from the laboratory during the past year and not included in the ninth scientific report are to be dealt with on a future occasion

Dealing first with fowl tumours, Dr Murray says that, in the Rous I sarcoma, the filterable endothelioma (M H 2), and the filterable fibrosarcoma (M H 1) we now possess three growths of the fowl microscopically distinct Biologically they form a graduated series, Rous I being the most malignant and M H 1 the least It is believed that the detailed comparative study of the process of tumour induction in these three tumour strains will help to elucidate the mechanism by which their specific non cellular transmission is accomplished

Dr Cramer has attempted a solution of the problem of the non-cellular transmission of mammalian malignant neoplasms, approaching the problem from a new angle Starting from the well-known fact that repeated freezing and thawing leads to very efficient disintegration of protoplasmic structure and cell death in normal tissues, he has studied its effect on transplantable tumour cells of the mouse and rat The result has been that the majority of the sarcomata and all the carcinomata studied lose their transplantability after alternate freezing and thawing four times, *but two mouse sarcomata* and one rat sarcoma are, on occasion, still able to give tumours The positive results are not uniformly distributed over the whole series of experiments as isolated exceptions but especially in the case of one mouse sarcoma high percentages

of positive results occur in individual experiments, the preceding and succeeding series being completely negative Dr Murray indicates the need for regarding the results with reserve as there are many difficulties in the possible inferences discussed and although both tissue culture and study of the respiration of the thawed emulsion at body temperature gave negative results, survival of small numbers of especially robust cells cannot be excluded Drs Cramer and Foulds therefore carried out a series of parallel experiments with the Rous I sarcoma of the fowl It was found that, whereas Rous I in the filterable phase gave frozen and thawed emulsions of high potency, the same procedure robbed some of the non filterable tumours of their perfect transmissibility by means of grafts not previously damaged in this way The result illustrates the successive dilemmas which are encountered when the attempt is made to interpret the mammalian tumour findings either by an *ad hoc* assumption of exceptional resistance of some tumour cells or by postulating a non-cellular tumour producing agent in them

Experimental Carcinogenesis

Dr Cramer has continued his work on the subject of experimental carcinogenesis His attempts to duplicate Deelman's results had not been successful, and the experiments were extended to clear up the discrepancy Partial excision of the tarred area as soon as papillomatous nodules appeared only exceptionally led to the development of new proliferative centres either in the scars or near them The attempt was made to induce rapid malignant transformation of apparently quiescent warty growths by subcutaneous trauma This was done either by thermo-cautery or by lunar caustic pencil, the deep surface of the papilloma being reached by a flap incision In a considerable number of the warts treated a change in rate of growth set in within two weeks and active malignant growth ensued The result is interpreted as showing the existence of a local resistance to the malignant transformation residing in the adjacent connective tissues, which can be broken down by sufficiently severe damage

Dr Foulds has made a careful histological study of neoplasm in the mouse derived from the endothelium of blood vessels and he has demonstrated that all the resultant tumours present a classical picture of haemangioma some of them showing evidence of low-grade malignancy It is thus clear that the action between the spread of the haemangiomata of the human being and the pre-existing normal vessels is established

Other Researches

Dr Cve had noted certain anomalies in the strain of mouse carcinoma 63 maintained in his laboratory in its reactions to the tissue immunity following injection of normal embryonic emulsions A reinvestigation of the phenomena of concomitant immunity in this and other strains of transplantable mouse tumours was therefore undertaken by Dr Foulds and it was found that

> while our own strain of carcinoma 63 produced practically no concomitant immunity to reinoculation the Gve strain did so inhibiting successful reinoculation in 40 to 50 per cent of the animals bearing progressively growing tumour Having become accustomed to grow in animals with acquired resistance the strain had become insensitive to the resistance produced by inoculation of normal emulsion A similar change was even more strikingly exemplified in the case of mouse carcinoma 206 This strain for many years has been characterized by a rapid initial growth on transplantation followed by complete regression of the majority of the tumours some of which may have reached a weight of two or three grams Recently this regression has become less pronounced and in many series the majority of the mice have presented progressively growing tumours When their immunity reactions were tested against our laboratory strain of carcinoma 63 they were found to be highly resistant reinoculation being completely negative Reinoculation with carcinoma 206 however gave the opposite result all or nearly all reinoculations being successful The change in behaviour in the strain is therefore clearly due to a loss of sensitiveness to the resistant condition which the inoculation of this tumour still set up in normal mice Attention is drawn to the significance of the results and the necessity for a detailed knowledge of the concomitant immunity reactions of any strain used for therapeutic experiments.

In a paper demonstrating the subepithelial plexus of the normal mouse skin Dr Ludford presents a careful study of the problem of the existence of a functional innervation of malignant new growths He has also undertaken an examination of the chromosome constitution of transplantable tumour strains and his work may show the way to a clearer understanding of the nuclear constitution of cancer cells in which the late Professor Boveri considered that the chromosome constitution was defective

Dr Murray's paper on a polychrome staining method for histopathological material concludes the ninth scientific report

Treasurer's Report

Sir George Makins in his report as honorary treasurer of the Fund points out that the fixed income fell short of the ordinary expenditure by £3 645, and, were it not for Lord Atholstan's grant of £2,000 per annum and also other donations the financial position would be a very difficult one Unfortunately the Fund can count on only two more instalments of Lord Atholstan's grant and therefore the treasurer appeals to others to assist in pursuing the researches to a successful termination

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

ANNUAL COURT OF GOVERNORS

THE annual meeting of the Court of Governors of the London School of Hygiene and Tropical Medicine was held on November 28th SIR HARRY GOSCHEN, chairman of the Board of Management, in presenting the sixth annual report referred regretfully to the illness of Sir Andrew Balfour, director of the school for whom a further prolonged period of sick leave had been necessary The Board had appointed Professor W W Jameson to be dean of the school in his absence In referring to the reception to the Colonial governors given at the school in July last Sir Harry Goschen said that this was preliminary to a visit to the Colonies by the director from which visit the school had high hopes The school and its predecessor had rendered most valuable services to the Colonial Governments in the staffing of the Colonial Medical Service with properly trained men, and the high standard of the courses of study in tropical medicine and hygiene was being maintained

With regard to the financial situation Sir Harry Goschen said that this was satisfactory up to a point The Court of London University had secured to the school an Exchequer grant for a term of years at the rate of £40 000 per annum. The school however had to supplement this by voluntary effort not only to meet the cost of the present programme but of developments especially in regard to industrial medicine and hygiene which were already pressing for attention It was essential that a university institution such as the school with large and increasing responsibilities should be able to expand and develop and for this it must possess a large endowment independent of any Government grants, and be free from hampering financial anxiety

Professor W W JAMESON the dean presented a report on the working of the school during its first year of occupation of the present premises in Gower Street The report consisted principally of contributions by the heads of the various divisions and departments, summarizing the work done He spoke of the way in which the various divisions of the school had been equipped the staffs completed the students enrolled and the methods of teaching re designed In the first academic year, 217 post graduate students had been enrolled 144 of this number attending the courses in tropical medicine and hygiene, and 51 those in public health Rather more than one third of the students had come from the Colonial Services. In addition 75 non medical persons proceeding to the Tropics, including Indian Civil Service probationers had attended the lectures in tropical hygiene Out of 84 competing 50 had gained the D T M and H Eng

The dean went on to refer to the valuable assistance afforded by the Seamen's Hospital Society whose recent extension of the Hospital for Tropical Diseases provided a centre for the teaching of tropical medicine in association with the school of which the whole Empire might be proud He commended to the Court the school's activities in the divisions of medical

zoology, of bacteriology, of biochemistry and chemistry, and of epidemiology and vital statistics As regards the public health division, which he described as the general utility division of the school, a valuable liaison was being rapidly established with the public health services, not only in this country, but in all parts of the world A beginning had been made with the teaching of industrial physiology and medical industrial psychology, in both of which branches of study considerable problems were pressing for the attention of the school The first year's experience of working with his colleagues in the new building led the dean to remark that no one of them had a single doubt as to the contribution which this school could make, whether by teaching or by research, or even by merely providing a meeting place for students with community of interests in the great allied subjects of hygiene and tropical medicine

NEW LAWS FOR MOTORISTS.

SUMMARY OF CHANGES

WITH the exception of certain provisions relating particularly to commercial vehicles, Part I of the new Road Traffic Act came into operation on Monday, December 1st The Automobile Association has prepared the following summary of the main provisions and changes in the law, which amplifies in various respects the information given by Mr Stenson Cooke in our issue of November 15th (p 830)

Driving Licences

The minimum qualifying ages are for motor cars, 17 years (no change), for motor cycles, 16 years (previously 14), for heavy motor vehicles exceeding 2½ tons in weight unladen), 21 years (previously 17) Existing licences will be valid for their unexpired period, except in the cases of motor cyclists under 16 years of age and the drivers of heavy motor vehicles under 21 Persons in these categories will be granted a new licence subject to their satisfying the authority that they were in the habit of driving a vehicle of that particular class during the six months ended December 31st, 1929

The licence must be produced for examination on the request of any police officer, to enable him to ascertain the name and address of the holder of the licence the date of issue and the authority by which it was issued If unable immediately to produce the licence, the driver must produce it in person within five days at any police station he may specify at the time of the request for production

When the licence is granted the holder must forthwith sign it with his ordinary signature The necessary forms can be obtained from the county or county borough council where the applicant resides

Physical Fitness

A declaration of physical fitness must be made at the time of application for a driving licence (see *British Medical Journal*, November 22nd p 882) Epilepsy liability to sudden attacks of disabling giddiness or fainting, and inability to read a motor car number plate with six letters and figures at a distance of 25 yards in good daylight (with the aid of glasses if worn) are disabilities described as a bar to obtaining a driving licence Any person suffering from a disability other than those stated above may if refused a licence claim the right to a driving test unless he is able to declare that he has driven safely for six months preceding his application when he will be granted a licence without test (fee 10s) A learner's licence will be obtainable at a fee of 5s Every applicant refused a licence has a general right of appeal to the police court in the neighbourhood where he resides and the court has power to reverse or affirm the decision of the licensing authority

Dangerous and Careless Driving

Dangerous driving penalties are increased to a maximum fine of £50 or up to four months imprisonment for the first offence and a maximum fine of £100 or up to four months' imprisonment or to both such fine and imprisonment, for the second or subsequent offence A person cannot be convicted of dangerous driving unless (*a*) he was warned at the time the offence was committed or (*b*) the summons was served within fourteen days or (*c*) either he or the owner received within fourteen days a notice of intended prosecution giving the essential details Persons charged with this offence may elect to be tried by jury

Driving without due care and attention, or without reasonable consideration for other road users is a new offence punishable by a maximum fine of £10 for the first offence and a maximum fine of £20 or imprisonment up to three months for the second or subsequent offence

Driving under Influence of Drink or Drugs

Driving or attempting to drive, or being in charge of a motor vehicle, on a road or other public place, when under the influence of drink or drugs, to such an extent as to be incapable of having proper control, is punishable, for the first offence by a maximum fine of £50 or imprisonment up to four months, and for a second or subsequent conviction a maximum fine of £100, or up to four months' imprisonment or to both such fine and imprisonment Persons charged with this offence may elect to be tried by a jury

Accidents

If an accident occurs causing damage or injury to any person, vehicle, or animal, the car must be stopped immediately and the driver must give his name and address, also the name of owner and car number, if requested by any person having reasonable grounds for requiring the information If an accident occurs, and the driver for any reason does not give his name and address, he must report the facts to a police station or to a police constable, as soon as reasonably practicable, and in any event, within twenty four hours

Driving off Highways

Driving without lawful authority on to common land, moorland, or any land not forming part of a road or any highway, or foot way except for a distance of 15 yards, for the purpose of parking, is prohibited

Miscellaneous Provisions

Other paragraphs of the A A's summary refer to pillion riding, and to the prohibition of unauthorized use of cars ("joy riding"), tampering with motor vehicles, and racing and speed trials

The operation of the remaining provisions of the Act, including compulsory third party insurance and the abolition of the twenty mile speed limit, is deferred until the New Year Meantime, following the recent issue of its preliminary booklet, the legal department of the Automobile Association is preparing a comprehensive book dealing in simple language with the whole Act and Regulations

MEDICAL CONGRESSES, 1930-31

THE following congresses and conferences on medical and allied subjects have been announced for 1931 and the remainder of this year Particulars are given below in the following order: date, name of organizing body, place of meeting, name and person to whom inquiries should be addressed More detailed information about these meetings is given from time to time as it becomes available, in the news columns of the *British Medical Journal*

December 11–13—Central Association for Mental Welfare London Secretary of Association, 24, Buckingham Palace Road S W 1

December 27–30—Pan Russian Congress of Microbiologists Moscow Office of Congress, Povrouska 44, Moscow

April 9–10—German Psychiatric Society Breslau

April 12–16—Congress of Psychology Hamburg

April—German Balneological Society Bad Ems

May—Royal Institute of Public Health Frankfurt Secretary of Institute, 37, Russell Square, W C 1

June 8–13—International Hospital Congress Vienna Professor Tandler, 9, Rathaussstrasse, Vienna

June—International League against Trachoma Budapest

July 4–11—Royal Sanitary Institute Glasgow Secretary Institute, 90, Buckingham Palace Road S W 1

July 21–24—British Medical Association Eastbourne Financial Secretary of British Medical Association, Tavistock Square, W

July 27–31—International Congress of Radiology Paris Secretary of Congress, 34, Boulevard de Vaugirard, Paris VI

August 4–8—International Dental Congress Paris Mr A F Rowlett, 165, London Road Leicester

August—International Congress for Industrial Medicine General Mr G L Perry, Industrial Welfare Society, 51, Palace Street S W 1

August 31–September 4—International Congress of Neurology Bern

September 21—Faraday Centenary London Secretary of Royal Institution, 21 Albemarle Street, W 1

September 23–30—British Association Centenary Meeting London Secretary of Association, Burlington House, Piccadilly W 1

October 11–18—International Congress of Comparative Pathology Paris Dr Grollet, 7, rue Gustave Nadaud Paris 26

1931—International Congress against Alcoholism Warsaw

1931—International Congress of Military Medicine Budapest.

Scotland.

Edinburgh Royal Infirmary

THE twelfth annual meeting of the League of Subscribers to the Royal Infirmary of Edinburgh was held on November 25th under the presidency of Mr James Campbell, who remarked that despite the industrial depression, the total contributions for twelve years had amounted to over £220 000 which showed the power of the workers' penny. Mr Russell Paton, the organizing secretary, stated that in the past year £21,662 had been received from employees engaged in public works, business establishments, staffs of banks, insurance offices, schools, etc., and that these subscribers included more than 120 000 wage-earners. Several firms in the city and country districts subscribed one pound for every pound raised by their employees. Family circle members of the league were also specially desirable. Lord Murray, in presenting a statement of the year's work in the Royal Infirmary, said that during the past year over 20 000 patients had been treated in the wards—nearly 700 more than the highest previous number. The manager regretted that the only possible way to reduce the waiting list was to extend the building itself, it was therefore all the more necessary for everyone concerned to work for this extension. Lady Findlay referred to the valuable assistance given to the Infirmary by the League of Subscribers, whose record indicated the genuine affection of the public towards an institution which it had come to regard as its own. The help of the league was needed to raise £500,000. At present the nurses' accommodation was strained to its utmost, in the extension scheme it was necessary to bring the nurses together in one building and to give them the advantages of a community life. A building for the maternity hospital was also required, since its work was being carried out with great difficulty.

Glasgow Maternity and Women's Hospital

The fourth annual medical report of the Glasgow Maternity and Women's Hospital, prepared by Dr. J. S. Cruickshank, registrar to the hospital, and following the plan adopted in previous years, contains tabulated records of the work done during the period under review, arranged in accordance with the standard scheme suggested by the committee appointed by the Royal Society of Medicine for the unification of the clinical reports of maternity hospitals. Of the 114 beds in the hospital twenty-five were reserved entirely for the ante-natal department, but as a number of extra beds were always in use the average number of patients in residence per day was no fewer than 143. By arrangement with the Glasgow Parish Council a number of beds were made available in Stobhill Hospital, thus enabling the Maternity Hospital to continue its policy of not refusing treatment to any woman in labour. The ante-natal department works in co-operation with the ante-natal dispensary, from which many cases are admitted either to the ante-natal wards or to the obstetrical department. Combined with this ante-natal dispensary are a post-natal dispensary and a child welfare centre, at all of which the total attendances during the year numbered 17 857. A certain number of emergency cases are admitted to the wards from "the district," others are sent to the hospital by medical practitioners and midwives, and even by other institutions. Finally, included among the admissions is one group of patients who have come to the hospital after the onset of labour without having been seen by a doctor or a midwife. In these circumstances, states Dr. Cruickshank, the simple division into "booked" cases and "emergencies" cannot easily be applied to this hospital, and it has been found necessary for the purposes of record to place cases into three categories—those that have been under ante-natal supervision, emergencies, and those cases, other than emergencies, that have not had ante-natal supervision. Of the 3 841 patients admitted to the hospital 1,346 came within the first category, 1,671 within the second, and 823 within the third. Besides these the hospital treated 3 820 patients in their own homes, and 821 in the beds specially reserved at the Stobhill Hospital.

Past and Present Aspects of Therapeutics.

The opening meeting for the session of the Pharmaceutical Society of Great Britain was held in the Society's Hall, Edinburgh, on November 28th, when Mr. Charles Sump (Aberdeen) occupied the chair. In the course of his inaugural address Professor Ralph Stockman (Glasgow University) said that treatment involved two important considerations—namely, the principles on which treatment was based and the method by which they were applied. Referring to certain aspects of present-day therapeutics he said that account must be taken of the influence exercised by manufacturing drug firms upon current practice by persistent and specious advertising of their own special products. The elaborate quasi-scientific and clinical dissertations which were freely showered upon the medical profession were not guarantees of a profound knowledge of pharmacology or of therapeutics. It had to be admitted, however, that the medical profession owed the introduction of some good remedies to manufacturing chemists, who also deserved gratitude for furnishing reliable preparations of proved and attested remedies; but they should not adopt the role of teachers of pharmacology and therapeutics. Treatment by serums and vaccines, and the development of endocrinology had a very dubious record from the point of view of therapeutic activity. A weakness in the medical curriculum was that the student received a large amount of mere description and had to do an equal amount of mere memorizing, there was a minimum of such mental discipline as was provided by mathematics or physics which tended to develop reasoning power. This training was specially required in therapeutics, which demanded an early cultivation of clear ideas of the principles and methods on which individual cases were treated. Treatment should be given as much prominence as diagnosis in clinical teaching, and some actual experience in treatment during a student's course was desirable. If a medical court with medical judges, solicitors, advocates and juries was instituted to pronounce on the worth of new drugs, treatments and operations it might be of incalculable benefit to the medical profession and a protection to the public.

Ultra-violet Rays in Medicine.

A health lecture upon the influence of sunlight on fresh air and nutrition was delivered at Edinburgh on November 26th by Dr. John B. King, who said that reference to the subject of radiations had been greatly simplified in recent years by the increasing familiarity of the public with this idea in the form of wireless waves, and with the extended use of x rays in medicine. In spite of the keen interest in the whole question of treatment by light, ultra-violet rays, x rays and radium, however, it was not very widely realized that all these forms of radiation were essentially of the same nature, differing only in their wave length. One of the best-known effects of the ultra-violet rays was the formation of vitamin D by their action on the skin. That rickets was due to a deficiency of sunlight began to be recognized about the beginning of the present century. The artificially produced ultra-violet rays were not used in medicine until 1893, when Finsen started his clinic for the treatment of lupus at Copenhagen. Ten years later Rollier established a centre at Leysin for the treatment of bone and lung tuberculosis, since that time both these clinics had done excellent work, so that sunlight clinics had been established in every country in the civilized world. About 1925 a surprising boom in artificial ultra-violet ray treatment started in Great Britain, which at first was taken up by untrained workers, with inevitable results. A reaction had set in, and ultra-violet ray treatment had come to be regarded as the fad of unbalanced enthusiasts. Nevertheless, this form of treatment had a very definite place in therapeutics, as would be recognized in time. Great interest had recently been aroused in the irradiation of food, irradiated milk had proved a potent agent in the curing of rickets.

Ireland.

Vital Statistics for Northern Ireland

During the quarter ended September 30th, 6,513 births were registered in the twenty-seven superintendent registrars' districts in Northern Ireland. This number represents an annual birth rate of 20·9 per 1,000 of the estimated population, the equivalent figure for England and Wales being 16·6, and for Scotland 18·7. The rate in Northern Ireland is 0·2 above the rate for the corresponding quarter of 1929, and 1·8 below the average rate for the third quarters of the ten years 1920 to 1929. Deaths registered during the quarter numbered 3,486, or an annual rate of 11·2 per 1,000, being 0·2 above the rate for the corresponding quarter of 1929, and 1·2 below the average rate for the third quarters of the ten years 1920 to 1929. The urban mortality from the principal epidemic diseases recorded during the quarter was equivalent to an annual rate of 0·5 per 1,000 of the population, the death rate from these diseases being 0·2 for the remainder of Northern Ireland. Deaths from cancer numbered 330, or an annual rate of 1·06 per 1,000, compared with an average rate of 1·09 for the third quarters of the previous five years. The number of deaths of infants under 1 year of age was 34·9, or 10 per cent of the total number of deaths registered. This quarterly return includes the usual notes on the weather during the three months, supplied by the director of the meteorological office in Belfast.

Inquiry in County Galway

The failure of the County Galway Board of Health to appoint an assistant county medical officer of health was the subject of a recent inquiry, held in Galway by Mr. A. Delaney, inspector of the Local Government Department. The secretary said that a resolution was passed by the board stating that it only desired to save the county from being saddled with expenses which it could ill afford. The appointment of a medical officer of health cost the county £1,400, of which £400 was recovered from national funds. It was now asked to meet an additional expenditure amounting to £1,300, and it was satisfied that if the plan were carried through it was only the beginning of a scheme which would land the county in bankruptcy. It had already established a first-class hospital service. In England the Public Health Act of 1929 had granted local autonomy to the county councils in all health matters within their areas. The secretary read a considered opinion of the medical staff of the Galway Central Hospital, that if the scheme were put into operation in the 367 schools in County Galway it would cost over £10,000 per annum. An alternative scheme suggested was that the county medical officer of health should attend the various tuberculosis dispensaries in the county as part of his work, and that the medical department of the Central Hospital should be responsible for Galway Sanatorium, or that the dispensary doctors of the areas should attend at the dispensary for tuberculous patients. With regard to child welfare, the poor children should be treated by the dispensary officers, and the children of the rich would have the treatment provided by existing medical services. They would advise the board to terminate the appointment of the two nurses whom the Ministry had ordered to be appointed in connexion with the county medical officer's appointment.

Dr. Butler O'Beirne, county medical officer of health, said that it was absolutely necessary that an assistant should be appointed. Before his appointment he had been county tuberculosis officer, and looked after the sanatorium in Galway, a dispensary there, and six dispensaries throughout the county. If the assistant were appointed, this would be part of his duties, but as no one had been appointed he was attending to the sanatorium and to the Galway Dispensary while the others were being neglected. The local dispensary doctors looked after the tuberculous patients as well as they could in the dispensary districts. Replying to Mr. A. Lynn, who, with Mr. Conor Maguire, appeared for the Board of Health and County Council, he said he had prepared his scheme for examination of school children, and it would involve an enormous amount of work, which it would be impossible for him to do along with his other duties.

Mr. Lynn contended that they were not legally bound to appoint an assistant medical officer of health, in the case of the nurses, the department could have referred the matter to the Appointments Commissioners, who would have appointed them, but for some obscure reason a different attitude had been preferred. The board could show that it was doing the work with an efficiency not excelled by any board of health. It was grotesque to suggest that two nurses could look after an area so large as County Galway, or that even the county medical officer of health and an assistant could do it efficiently. The alternative scheme put forward by the Galway Hospital doctors was the only feasible one, and would enlist the services of the existing dispensary doctors who would work as a team under the county medical officer. In this way they would save a considerable amount of money, and the health of the county would be looked after more efficiently.

Dr. Thomas Walsh, professor of pathology in Galway University, and an ex-chairman of the Galway Board of Health, gave evidence in support of the alternative scheme put forward by himself and his colleagues. They had the existing machinery, and it was only a question of co-ordinating it. What he felt about the department's proposal was that they had an exact knowledge of its extent. If they inspected schools and set up child welfare centres, it would be useless unless there was treatment of all defective scholars. An effective scheme of this kind would mean that four or five extra doctors would be required, and he did not think this expense was justified. The great obstacle in County Galway was poverty, but, unfortunately, they could not touch it.

Salaries of Medical Officers

At the last meeting of the Wexford County Health Board a letter was read from the Department of Local Government and Public Health stating that the scale salary of £200 a year, increasing by £5 to £250 a year, proposed to be adopted by the board for medical officers of dispensary districts in the county, was inadequate, and compared very unfavourably with the salaries in operation for similar duties in adjoining counties. The Minister requested the board to reconsider this matter, and to adopt a scale for these officers having a maximum of at least £300 a year.

England and Wales.

Hospital Saving Association

The Prince of Wales attended the annual meeting of group representatives of the Hospital Saving Association, which was held on November 25th, at Kingsway Hall, London. His Royal Highness remarked that he himself, as president of the King Edward's Hospital Fund, took part in some of the consultations which led to the launching of the Hospital Saving Association, and was present at meetings when Sir Alan Anderson, Lord Knutsford, and others suggested the scheme. The growth of the association during seven years had been amazing, there were now over 800,000 contributors, and he saw no reason why the million mark should not be reached within a year. The secret of this rapid growth, the Prince continued, lay in the fact that this was a voluntary movement for the help of the hospitals and for the mutual help of the contributors. The "threepenny bits" which made up the staple of the contributions had come in with a regularity "which might cause envy to the tax collector." The association was laying down a very sound basis of finance for the voluntary hospitals. He emphasized the altruistic side of the endeavour, that the contributions were made, not merely or chiefly as an insurance for the contributor, but to "help the other fellow," and as a token of thankfulness that one did not need hospital treatment one's self. He reminded the gathering that these sums did not meet

the full cost of hospital provision, which the modern methods of medical science caused continually to become more expensive, but the association did enable the hospitals to maintain an open door and eased the anxiety of those responsible for their management. Lord Knutsford and Mr. A. V. Alexander (First Lord of the Admiralty) briefly spoke, the former remarking with regard to the new council hospitals, that he hoped they would be able to take many of the cases which for lack of accommodation had been too long awaiting admission to the voluntary hospitals. Mr. Alexander confessed that after the war he and many of his colleagues thought the situation of the hospitals so serious that there would have to be a much wider provision of State hospital service than had hitherto existed. But there had been an extraordinary recovery in hospitals and hospital finance, especially in the provinces. He wanted to see a complete co-ordination between the voluntary hospitals and those now described as council or municipal. Mr. Stanley L. Duff, secretary of the National Conference of Approved Societies, also addressed the meeting.

The eighth annual report, which was presented, showed that during the twelve months ending in July the number of contributors increased by 158,431, now reaching a total of 810,474. The amount of contributions paid during the year was £438,354, *compared with £320,714 in the previous year*. During the year 238,929 contributors or their dependants had been treated at voluntary hospitals, and of these 44,340 were in patients, who were in hospital for a total of 911,873 days, an average of 20·1 days per case. The revenue account for the year showed a credit balance of £22,059. The total payment made for hospital services for the year would be after the final distribution had been made £325,781, of which £264,324 was direct payment to voluntary hospitals, £37,899 direct payment to rate-aided institutions, and the remainder refunds of hospital payments made by contributors.

Care of Feeble-minded in Birmingham.

In his report for the year ended March 31st, 1930, Dr. A. M. McCutcheon, medical superintendent of Monyhull Colony and Monyhull Residential School for Feeble-minded and Epileptic Children, takes the opportunity of the year under review, being the last in which the work was carried out under the authority of the board of guardians, of recording briefly the history of the colony since its establishment in 1908. Important developments took place in 1912, when new homes were planned, in 1914 when the 'Haunch' was leased for adult female patients, in 1924 when 'Trostery" was bought and equipped for the same purpose, in 1925 when two new homes were built, and in 1928 when provision was made for the night nurses' home. But Monyhull as a modern specialized mental hospital developed mainly from 1921, in that year receiving recognition as a training school for nurses and a year later similar recognition by the University of London as a place of study for the diploma in psychological medicine. In 1923 it was incorporated in the Birmingham Joint Board of Mental Research. During the year under review 1,346 patients were dealt with in the colony and residential school, 1,206 of these remaining in residence on March 31st. An analysis of the discharges shows that 47 patients were transferred to the adult section, 19 to their parents and other authorities, 37 to hospitals and other institutions, and 1 on licence. In addition there were 17 cases of absconding, 2 of failure to return from leave, and 17 deaths. Applications for discharge work out at 1 in 74 of the average daily population, a satisfactory figure when allowance is made for the fact that some parents, failing to appreciate the true mental condition of their children, make repeated demands for discharge, to which in most cases the Board of Control finds itself unable to accede. Of the patients in residence 9 are classified as idiots, 248 as imbeciles, 931 as feeble-minded and 18 as sane epileptic. Included in the first three categories are 259 patients with epilepsy as an added defect. In the circumstances the figures relating to occupational training are very satisfactory, during the year under review all the shops were busily occupied, the patients—namely 373 males and 449 females—showing the greatest interest in their work. Only 19 males and 11 females are classified as not suitable for regular employment. In the school 429 children were dealt with during the year, of these 72 have been discharged, in every case with appropriate recommendations as to future training and control.

Medical Examinations of the L.C.C. Staff

The London County Council is considering the question of the arrangements to be made for the conduct of the medical examination of the council's staff after the retirement in February next of Sir John Collie, the present medical examiner. The General Purposes Committee has come to the conclusion that the most satisfactory arrangement would be to entrust the work of medical examination, with certain exceptions, to the medical officer of health and school medical officer who at present acts in this capacity in respect of the teaching and certain other staff under the direction of the Education Committee. This would ensure a common standard of examination, all records would be in common form, and the great resources which the council now possesses in respect of consultants, laboratory facilities, hospital accommodation, etc., would be readily available. Medical examination in the council's service takes place before admission, after a prolonged period of sickness, after accident on duty, and when the question of physical fitness to remain in the service is in question. The number of examinations amounts to over 20,000 a year. The adoption of the proposal will involve the appointment of one additional principal medical officer. The report of the committee adds: 'We think it proper to state that the medical officer is suffering very severely at the present time from intense pressure of work arising out of the Local Government Act, 1929, and for this reason hesitates to undertake additional work of a very responsible character as he feels he could not conscientiously discharge his duty to the council in connexion with it unless the facilities mentioned (certain details regarding staff and adaptation of accommodation) are available.

India.

Standardization of Medicinal Drugs.

THE Government of India, after obtaining the approval of local Governments, has now decided to appoint a small committee to explore and define the scope of the problem of the standardization and preparation of medicinal drugs. It is further instructed to ascertain what measures may suitably be taken to regulate their subsequent supply to the community. The terms of reference to the committee are as follows:

1. To inquire into the extent to which drugs and chemicals of impure quality or defective strength, particularly those recognized by the *British Pharmacopœia* are imported manufactured or sold in British India and the necessity in the public interest of controlling such importation, manufacture, and sale and to make recommendations.

2. To report how far these recommendations may be extended to known and approved medicinal preparations other than those referred to above and to medicines made from indigenous drugs and chemicals.

3. To inquire into the necessity of legislation to restrict the profession of pharmacy to duly qualified persons and to make recommendations.

The committee, which will have as its chairman Lieut.-Colonel R. N. Chopra, I.M.S., professor of pharmacology in the Calcutta School of Tropical Medicine and Hygiene, will visit important centres in the provinces and will collect evidence in this respect. It will also prepare a questionary for issue to persons and corporate bodies likely to be able to throw light on the matters at issue.

The Pasteur Institute, Calcutta.

According to the annual report for 1929 of the Pasteur Institute, Calcutta, over 24,000 patients have received a complete course of treatment since the institute was established in 1924. In five years the total number of patients has increased from 1,995 to 9,576—apparently the highest

number recorded in any Pasteur institute in India There is evidence, however, that many deaths occur every year among those who do not, or cannot, attend the institute for treatment In Bengal alone, excluding patients who received treatment, at least 400 deaths from hydrophobia were reported in 1928 The report states that, since about one in every sixteen of the untreated cases is estimated to develop this disease, probably about 6,000 persons in Bengal infected by rabid animals received no treatment during the year This figure is expected to be reduced as vaccine treatment becomes more widely available Good results appear to have followed the broadcasting of information about rabies by the Department of Public Health Out of 7,529 persons treated, only 54 died of hydrophobia—a rate of 0 72 per cent This is the lowest in the history of the institute

Medical Services of the G.I P Railway

The annual report of the medical department of the Great Indian Peninsula Railway for 1929–30 is chiefly concerned with the incidence of malaria among the railway's employees, who number as a rule over a million In recording a decrease of 10,000 cases during the year, Dr R J L Sliden, principal medical and health officer, states that the expenditure incurred on the treatment of this disease was nearly a fifth of the total cost of sickness Compared with the figures of the previous year, the most noticeable improvement evidently occurred in the Jubbulpore district, where the number of cases decreased by more than a thousand Among the anti-malaria educational measures adopted, large-scale maps were used to exhibit the results of malaria surveys, and breeding places shown on the maps are reported to have been regularly and systematically dealt with Influenza was prevalent among the staff throughout the whole system, the total number of cases recorded was 5,814, an increase of 1 9 per cent over the figure of the preceding year Employees suffering from pulmonary tuberculosis are considered unfit for continued employment, and are generally invalided out of the service the rate of mortality from this cause is estimated to be 12 out of 149 A slight increase is reported in the number of patients treated for venereal diseases, but it is suspected that information is sometimes withheld through fear of publicity and punitive action During a small-pox epidemic, which lasted from January to March of this year, arrangements were made at all the hospitals and dispensaries belonging to the Peninsula Railway to vaccinate the members of the staff and their families free of cost Primary and secondary vaccinations for the year numbered 10,678 compared with a total of 4,212 in 1928 Another section of the report deals with injuries caused by accidents, these amounted to 213 incurred by passengers, and 2,018 in the case of railway servants, the occurrence of fatal accidents per 100,000 passengers carried being 0 01 To give effect to a resolution passed at the eleventh International Labour Conference regarding the prevention of industrial accidents and the organization of "safety first" propaganda a central safety council has been established, consisting of representatives of the transportation, engineering mechanical, commercial, and medical departments, committees have also been set up at seven local centres As their object is to provide a means of educating employees in matters affecting their own safety, an opportunity is given for making suggestions and for discussing the results obtained by the various measures Rapid progress continues to be made in educating employees in first aid work Up to the end of the period under review the total number successfully trained was 2,739, which was equivalent to about 2 49 per cent of the staff

Correspondence.

MENTAL TREATMENT ACT, 1930

SIR,—With reference to the Explanatory Memorandum on the Mental Treatment Act, 1930, published in the *Supplement* of November 29th, may I point out two inadvertent mistakes, one of commission, and the other of omission

Under the section "Voluntary patients," and again under the section "Temporary patients," it is stated that these temporary patients are to be admitted under certificates from two medical men This should read recommendations as the word "certificate" is thought likely to offend the susceptibilities of the public

Under para 3 relating to certificated patients there is an alteration inasmuch as the provision for Urgency Orders is extended to all patients certified under the Lunacy Acts instead of being confined to those who are to be dealt with in private institutions—I am, etc,

Bath Nov 29th R C GORDON

SIR,—I trust that you will be good enough to allow me to point out that in the very serviceable Explanatory Memorandum on the Mental Treatment Act 1930 drawn up by the British Medical Association, there are several minor inaccuracies which, if uncorrected, may give rise to some misapprehension among medical practitioners

First, with regard to the medical recommendation required in the case of a person under 16, on whose behalf a written application is made for voluntary treatment, this must be made by the patient's own doctor, or by a practitioner approved by the Board of Control or *approved by the authority within whose area the person to whom the application relates then is*

With regard temporary patients, the Act is careful to avoid the word "certification" in this respect The application must be accompanied not by two medical certificates as stated, but by two recommendations It is as well to add also that no recommendation shall have effect on the expiry of fourteen days from the date on which the person to whom the recommendation relates was examined by the two medical practitioners, or, if he was examined on two different dates, on the expiry of fourteen days from the later of them

And lastly, the memorandum states that the procedure is not altered for certified patients That is so, except in respect of the Urgency Order Hitherto, the use of Urgency Orders has been confined to private patients, but by Section 17 of the Mental Treatment Act, 1930, it will be possible to admit a rate-aided patient to a public mental hospital under an Urgency Order signed by a duly authorized officer of the local authority within whose area the patient is This is a wise and beneficial provision—I am, etc,

T M DAVIE,
Medical Superintendent
East Riding Mental Hospital

Beverley, Yorks, Nov 29th

SIR,—In the *Supplement* with to-day's issue of the *British Medical Journal* an Explanatory Memorandum in regard to the new Mental Treatment Act is published The document is not signed and consequently one cannot appreciate the authority behind it It is at all times most difficult to state in concise sentences the relevant fact of any Act of Parliament This memorandum is inaccurate and misleading, and should be withdrawn May one express a hope that this communication will be published and so act as a warning to the medical profession in regard to the Explanatory Memorandum—I am, etc,

F ROWLAND ROTHERHAM

Hove Nov 29th

*** We have referred this correspondence to the Medical Secretary, who writes The memorandum was drawn up as directed by the Council As regards its alleged inaccuracies see the letter by Dr Gordon, one of its authors Unfortunately time did not allow of his seeing a proof

TEMPORARY TREATMENT WITHOUT CERTIFICATE

SIR,—The correspondence of the last few weeks on temporary treatment without certification brings out very clearly the confusion that exists concerning the meaning of Section 5 of the new Act, which deals with the question. If Dr Vernon Davies's interpretation is accepted—and he is in an exceptional position to give an interpretation—that the form of word, "incapable of expressing himself as willing or unwilling to receive treatment" means literally what it says, then it would appear that the intentions of the promoters of the Act have been practically nullified, for I do not think the section so interpreted will apply to 5 per cent of the admissions to mental hospitals.

The carrying out of the section however will depend upon the view taken by the Board of Control. That the Commissioners may not hold the same opinion as Dr Davies is indicated by the reference in their last report to the epoch-making character of the change caused by this section. Having regard to the obscurity of the situation, the importance of the point at issue, and the short time that now remains before the Act comes into force it would be helpful to all concerned for the Board to make known its official interpretation.—I am, etc,

London, W.1, Nov. 29th. FREDERICK DILLON.

ROLL OF BIO-PHYSICAL ASSISTANTS

SIR,—Will you allow me space to express the appreciation of the council of the Chartered Society of Massage and Medical Gymnastics of the steps taken by the British Medical Association to bring the Roll of Bio-physical Assistants to the notice of medical practitioners. The inclusion of the topographical section of the Roll in the *Supplement* to the *British Medical Journal* of November 15th is certainly a practical way of making known this register of 'persons competent to dispense the direct current, ionization, faradic currents, sinusoidal currents, diathermy, high-frequency currents, light and heat, and ultra violet light."

The majority of those admitted by the Society of Apothecaries to their register of lay assistants have qualified first in massage, and being members of the Chartered Society of Massage and Medical Gymnastics, are entitled to use the distinctive title of Chartered Masseuse or Chartered Masseur. The privilege was allowed by the Privy Council with a condition that the title was used only *without abbreviation*, and in view of this understanding the council was concerned to find that the initial letters have been used in the reference made in the Roll of Bio-physical Assistants as it appears in the *British Medical Journal*. There was not an opportunity to correct the omission before publication but our regret for the occurrence, together with a reference to the circumstances, has been conveyed to the Privy Council, and has been accepted by it. The council is glad to have this opportunity to inform readers of the *British Medical Journal* that the designation allowed to members of the Chartered Society must be used by them in full—Chartered Masseuse or Chartered Masseur.—I am, etc,

R. C. ELMSLIE,
Chairman of the Council of the C.S.M.M.G.

London, Nov. 25th.

THE WORK OF LABORATORIES

SIR,—My friend Sir Walter Fletcher, speaking of me in to-day's issue of the *British Medical Journal* (p. 928) says that when opening the Banting Institute of Toronto I "took occasion to belittle the work of laboratories." What I wrote of laboratory experiment was (*Lancet*, 1930, ii, 779): "Yet when fullest allowances are made the method remains one of extreme importance, of most fruitful results of a value indeed second in accuracy and relevance only to that of direct hominal research itself with which, whenever possible, it should be combined . . . and again: "Let no one for a moment suppose that I am critical of the methods or results of collateral experiment or of their great value in illustrating and elucidating the problems of hominal disease." Is this "belittlement"?

A further charge is made that I "thought that the idea that the laboratory workers did, or could, hand over new weapons for the physician to use was laughable." My statement with regard to laboratory workers was in the nature of a comment upon the following question asked in the annual report of the Medical Research Council: "Is scientific work by the physician or surgeon limited to the application in his art of scientific results worked out elsewhere in the laboratory, and delivered to him for use?" "and I said: "The assumption inherent in the question that ready-made weapons are fashioned in the laboratory and handed over with magisterial authority to the physician who humbly acquiesces in their prescribed use, is too amusing for serious discussion."

Sir Walter Fletcher is here twice guilty of grave offence. He garbles a story to deny it. It is not true that I took occasion in my address to belittle the work of laboratories. I praised such work and pleaded for its extension to human problems. It is not true that I was laughing at "the idea that laboratory workers did, or could, hand over new weapons," but it is true that I found the question as to whether the scientific work of physicians and surgeons was *limited* to the application of laboratory results very amusing. There is all the difference between my statement and the corrupt versions given by Sir Walter Fletcher, who, to my sorrow, has so egregiously failed to capture the spirit of my address.

Sir Walter Fletcher is Secretary of the Medical Research Council and research implies a disinterested pursuit of truth. He should therefore be quick on the scent of truth and be its guardian and apostle. I am wounded in the house of my friend when I find it agreeable to his standards of accuracy even in so small a matter as this, to injure truth so wantonly.—I am, etc,

London, W.1, Nov. 29th. MOYNIHAN.

ANTIMALARIA MEASURES

SIR,—Colonel Gill has now defined his position clearly. The reports, articles, and books on antimalaria work in Malaya speak with *no meaning to him*. To him the results are "equivocal." Major Walker, R.A.M.C. published in the January number of the *Journal of the R.A.M.C.* an excellent article entitled "Antimalarial measures in Malaya." *In it he says*:

> The result of all the work has been the opening up of vast tracts of hitherto forbidden land, the saving of thousands of lives and dollars, and of necessity a tremendous improvement in the general economic condition of the country. Millions of dollars have been expended on this work, but they have been returned a hundredfold.

Governments, Councils, State Boards, directors of companies, officials and unofficials, private citizens, Europeans and Asiatics, have spent millions over a period of thirty years. If Colonel Gill is right they have been in spending this money very foolish. If they have been right, what are we to say of Colonel Gill? I leave it to your readers. But can we be surprised that the work in Malaya has no lessons for him in India?—I am, etc,

Ross Institute, S.W.15, Dec. 1st. MALCOLM WATSON.

RESULTS OF TREATMENT OF CANCER

SIR,—As there may be delay in arranging such an exhibition of cases as Mr Fitzwilliams suggests in his letter published on November 29th, may I say that I am quite ready to accept his challenge to exhibit cases of breast cancer treated by x rays. My colleagues would probably agree to certain of their patients being shown at a Sectional meeting of the Royal Society of Medicine. Might I suggest that my work is not conducted in the dark? For the past nine years at the Middlesex Hospital I have seen cancer and other patients treated by x rays in a follow-up clinic at 2.30 p.m. on Wednesdays; radium patients are now seen on Mondays at 11.30. Any medical man who wishes to see patients is welcomed.

As regards tongue, rectum, and cervix cases my experience is almost entirely confined to "prophylactic" radiation after operation or to patients inoperable or with inoperable recurrences. Dr Hernaman-Johnson some years ago replied to a somewhat similar challenge from Mr Victor Bonney by showing how limited the gynaecological material sent to radiologists is in this country.

Mr Fitzwilliams mentions three sites in which radium is generally accepted to be of greater value than *x* rays (that is than the *x* rays of the present, and as now employed) Had he instanced cancer of the thyroid, of the testicle, and cranial tumours his challenge would have been more generously framed, and could have been more easily replied to

I propose to give a further paper on the treatment of operable cancer of the breast by *x* rays and radium at the Third International Radiological Congress next July in Paris, this will review my work to date, and show some five-year results At the same congress I believe there will be remarkable results brought forward from the *x*-ray treatment of cancer of the oesophagus, by a new technique from a Continental clinic We advance by degrees, and Mr Fitzwilliams might be gently admonished to ponder on Renan's saying that "La verite consiste dans les nuances" —I am, etc,

London W 1, Nov 29th J H Douglas Webster

GLYCERIN IN MIDWIFERY

Sir,—In all confinements there is a certain amount of injury to the perineum varying in degree—for example, bruises, lacerations, and tears Tears are stitched The only other treatment seems to be cleansing with weak antiseptic lotions by the nurse in attendance Bruised, lacerated, and oedematous tissue is the most likely field for micro-organisms to flourish in During the puerperium the damaged tissues are constantly bathed by lochia and vaginal secretion The reaction of the latter is altered These and the close proximity of the anus tend to favour the presence and growth of bacteria

It seems desirable in such cases to use an application which would inhibit the growth of bacteria, reduce oedema, encourage healing, and at the same time be soothing and comforting to the patient To obtain these results I find warm glycerin the most effective Glycerin does not evaporate, is powerfully hygroscopic, and inhibits the growth of bacteria, particularly the cocci and *coli* group, the causal organisms of puerperal sepsis

I first used glycerin in the puerperium for its soothing effect on haemorrhoids I was so pleased with its healing effects on the perineum that I now use it as a routine practice at every confinement Cases treated by this method showed no signs of sepsis —I am, etc,

Ronald Mackinnon, M B,
November 24th Honorary Pathologist Oldham Royal Infirmary

CYANOSIS WITH COLLAPSE

Sir,—Blue sickness, or cyanosis, occurs to-day in quite a number of chemical industries, and its significance varies with the cause In mild cases—nitrous fume inhalation, for instance—there is merely a loose linking up of the oxyhaemoglobin with the nitric body to form a nitric-oxide-haemoglobin, a forerunner of methaemoglobin, and such cases are very easy to re-oxygenate Occasionally there is an observable cyanosis, with normal blood and perfect health, a not uncommon state in T N T operatives In the benzene group conditions are altered, and become pathological Both the amido and nitro derivatives discharge the haemoglobin from the red cells and fix the oxyhaemoglobin Aniline, which is amidobenzene, possesses this toxic property and the nitro-anilines, and particularly para nitraniline an important body in many technical processes has this toxicity in much greater amount than aniline Nevertheless, I doubt very much if methaemoglobinaemia is the diagnosis for Dr Lempriere's case (*Journal* November 22nd, p 892) There is not enough benzene chemical (nitro or amido) to bring about this issue in one drop of dye The details are "Some on his lips and a drop in the mouth, immediately washed"

We have to remember that before clinical signs of poisoning by methaemoglobin appear a very considerable quantity has to be present W J Dilling places it at 40 per cent of the oxygen present, and states that it is only when this figure is reached that the characteristic bands show up the spectroscope Seen thus, the case is "Can 40 per cent of the oxyhaemoglobin present in a boy of 14 years be fixed by the atoms present in a drop of an aniline dye?" The only answer is, "Yes, by catalysis", and while this might appeal to a chemist as a reasonable answer, it is from a medical standpoint a *reductio ad absurdum*

But Dr Lempriere's letter has the great interest that it points to another possible form of aniline poisoning Many industrial physicians believe that particularly the nitro derivatives of benzene poison the central nervous system, and that not all of the complex symptoms including brain lesions, can be explained by the anoxaemia and it may well be that this case in point supports the idea My impression of what happened is as follows The boy was probably using a pipette (his lips were stained), and drew some of the aniline dye into the fibre stopping in the incisor socket It may have been one of the more toxic preparations, such as para-nitraniline This would dissolve the lipoids in the incisive nerve, whence there is a direct track to the pons I think the boy suffered from early narcosis and poisoning of the central nervous system, and that such a case might have been fatal—I am, etc,

Stevenston Ayrshire, Nov 24th Harry M Roberts, Medical Officer Nobel's Explosives Company Limited.

PARTURITION PER PERINEUM

Sir,—The case described in your issue of November 22nd (p 863) under the above heading is certainly very rare, but I had an almost identical case over twenty years ago, which was reported in the *Transactions* of the Glasgow Obstetrical and Gynaecological Society (vol v, p 148)

In my case, which was a persistent occipito-posterior presentation in a young primipara, I had applied the forceps in the usual way, when quite suddenly the perineum gave way in front of the anus, and the head appeared, to my consternation, through the "central tear," carrying the blades of the forceps with it I had hardly time to get the forceps out of the way before the child was delivered "*through the laceration*" The anterior and posterior boundaries of the perineum remained intact, and the laceration began in front of the anus and ran obliquely forwards to the left side of the fourchette and fully two inches beyond that point

The tear was carefully sutured, but the sutures had to be removed on account of sloughing With rest in bed, however, and frequent bathing of the parts with a weak solution of perchloride, rapid healing took place, and the patient bore several children afterwards without any recurrence The only explanation I can think of is the prolonged pressure of the head against the perineum No anaesthetic was used, and very little, if any, traction was necessary —I am, etc,

Alex J Wilson, F R C S Ed, D P H
Airdrie, Nov 24th

Sir,—I should like to record that four years ago I had a confinement case similar to that described by Drs Tindal and MacLennan in the *Journal* of November 22nd I was called to the case by a midwife, and on arrival found the child born, with the umbilical cord passing through a gap in the perineum of corresponding bearings to that in their patient The placenta followed spontaneously by the same passage, and the gap subsequently was closed by catgut sutures I am pleased to say that the gap healed and the patient got on well

The woman was a multipara, and gave the same history of having been badly torn at the previous confinement The perineum had been stitched, but evidently the distal sutures had not been inserted deeply, thus causing a dip in the upper portion of the vaginal passage, and a very attenuated perineal surface —I am, etc,

R Boyd Ronson, M B, Ch B
Seven Kings, Ilford, Nov 25th

Sir,—The memorandum by Drs Tindal and MacLennan is most interesting but the accident is by no means unique Sir J Y Simpson recorded a case of "Perineal fistula left by the transit of the infant through the perineum" in the *Edinburgh Medical Journal* (1855, i, 1)

The patient a primipara was first seen by him a year after the confinement An illustration was published along with the communication and it was reproduced in the *Manual of Gynaecology* by Hart and Barbour In his paper Simpson referred to two other cases The first of these described by Marter of Konigsberg was also a primipara, but in spite of the fistula remaining patent, her second child was born naturally by the vulva The second case was described by Halmagrand of Paris who repaired the perineal tear Her next child was born naturally It is not stated whether she was a primipara or a multipara In addition to these, the names of seventeen other medical men who have reported similar cases can be found in *Anomalies and Curiosities of Medicine* by Could and Pyle (pp 121-22) One of the cases quoted by them was recorded by Brown in the *Lancet* (1860, i, 496) —I am etc ,

D P BLAIR

Waterloo, Liverpool, Nov 25th

DIATHERMY ENUCLEATION OF TONSILS

SIR —I am astonished at Dr Dan McKenzie's "warning" (as he rather rigorously styles it) against the growing practice of enucleating tonsils by means of diathermy (*Journal* November 22nd) He further states that this is not the place to enter into a full discussion on the subject, and ends by saying unkind things about anyone who unjustifiably disregards his letter

Now I have a copy of Dr McKenzie's excellent book at hand, and I note on page 64 Enucleation by dissection can be safely and successfully accomplished by the diathermy knife' A description of his method and the control of haemorrhage follows, with the advice that 'this method of inducing haemostasis by diathermy' may be used in the ordinary tonsil operation On page 71 where he describes how tonsils can be diathermized easily and comfortably under local anaesthesia," we find If the patient is nervous and the tonsil small, we limit ourselves to a *single* application of diathermy" Page 72 emphasizes my own observation that the patient's endurance is never seriously taxed page 75 adds that he had had no personal experience of serious haemorrhage

In view of the general interest in this work among practitioners, I should like to state briefly my experience of the last four years One or two applications of diathermy are invariably sufficient when the technique described by me in the *British Medical Journal* of June 14th is carried out Cocaine anaesthesia is always used *without* adrenaline This latter addition appears to favour oozing, I believe the blood normally present in the vessels helps, when coagulated, to prevent bleeding I do not agree with Dr McKenzie's technique in this respect, and I personally feel that one month should elapse before the second treatment, should one be required I hope my own experience will encourage others in a method which I believe to be as safe at any age as any treatment could possibly be —I am, etc ,

WARNER COLLINS

Putney Hill, S W 15 Nov 22nd

NOCTURNAL INCONTINENCE IN CHILDREN

SIR —In regard to Dr Pereira Gray's memorandum in your issue of November 29th (p 906) I have found ergot the only satisfactory drug in many cases of this distressing disorder The liquid extract in five-minim doses to a child of 5 years combined with half the quantity of liquorice and a drop of peppermint, often brings about permanent relief in a fortnight, and is worth a trial in most patients so afflicted The prescription was published some years ago and it is at last beginning to find its way into the textbooks where belladonna and the bromides reigned for a century in masterly inactivity —I am etc ,

ALEX PATTON

Widnes, Dec 1st

SIR —Having extensive experience in genito-urinary surgery in a land where stone in the bladder was very prevalent—two-thirds of the stone in India is in children under 12 years of age—it was a very common thing for people to bring me children, and when asked what was the matter the reply came promptly Stone in the bladder" The villagers are familiar with the symptoms The child is constantly fingering his penis and having erections and incontinence and these are the symptoms common to stone and nocturnal incontinence In this case considering the prevalence of stone, the first thing to do is to examine for stone but no stone being found, the condition reduces itself to the prepuce, which will not retract, and is not improbably adherent A circumcision is then done and the irritating secretion underneath the prepuce removed, and the symptoms of stone and the incontinence disappear at once In my experience these cases of incontinence disappear after circumcision, and I am surprised that this fact has not yet been recognized in teaching institutions I have been consulted about similar cases in this country in which circumcision was followed by a similar result —I am etc

Slough, Nov 30th

COLLAPSE FOLLOWING ANAESTHETIC

SIR,—Sir Maurice Craig's experience (described by him in your issue of November 22nd, p 886) recalls the following to my mind

About the year 1884 one of the house-surgeons at St. Bartholomew's Hospital chloroformed a cat When it was apparently dead he took it by the tail and carried it out for burial As he went across the square the cat recovered He told Mills the chloroformist" about it and I think it was after that that inversion was used in chloroform collapse The matter was discussed with Henry Power a keen physiologist who said that the treatment was physiologically incorrect On being asked what treatment he would adopt in such cases, he replied Oh invert by all means *but it's wrong*"

In my own experience I have seen three cases of collapse after chloroform in children They all recovered rapidly on being treated by complete inversion —I am, etc

PRIDEAUX G SELBY

Lyndhurst, Nov 26th

LOTTERIES SWEEPSTAKES AND HOSPITAL FINANCE

SIR —Is the time not ripe for the British Medical Association to express an opinion on lotteries sweepstakes and hospital finance The Hospital Police of the Association is silent on this aspect of the hospital question Why? Surely the medical profession will never consent to cure physical disease by propagating moral disease and that is the meaning of financing hospitals by lottery and sweepstake Gambling is an odious perversion of a natural and healthy instinct—the sporting or adventurous instinct —and its extension among the people of this country will sap their moral fibre, pervert their sense of value, and lower the prestige of the medical profession It the hospitals cannot be financed by voluntary contributions let them be put on the rates and taxes at once The "bookie" must be kept out of the hospital question at all costs, and the British Medical Association should see to this —I am, etc ,

Obituary.

JOHN HAMMOND TEACHER, M.A., M.D.,

St Mungo (Notman) Professor of Pathology, University of Glasgow

PROFESSOR JOHN HAMMOND TEACHER, who died on November 21st, was born near Glasgow in 1869, his father, the late Mr William Teacher, being a prominent figure in Glasgow business circles for many years He was educated at Glasgow Academy and University, graduating in arts in 1889, and in medicine with high commendation in 1893 After holding the posts of house-physician and house-surgeon at the Western Infirmary, he took up for some time the study of physiology under the late Professor McKendrick Pathology, however, proved a superior attraction, and he moved to the pathology department of the Western Infirmary under the late Professor Coats

Dr Teacher soon established a reputation for painstaking and tireless research, developing a bent towards gynaecological pathology In 1896 he spent an interesting year in Rio Tinto, where he was responsible for the control and treatment of malaria in the district Returning to Glasgow in 1897, he undertook the arduous task of classifying and arranging the anatomical and pathological preparations of William Hunter The masterly catalogue, which he published in 1900, is classical of its type, its value having been somewhat tardily discovered in recent years While engaged in this work he was appointed pathologist to the Sick Children's Hospital, and assistant pathologist at the Western Infirmary He became a Fellow of the Royal Faculty of Physicians and Surgeons in 1900 The outcome of his early researches in gynaecological pathology conducted in Glasgow and Vienna was a thesis for the degree of M.D., for which he chose chorion-epithelioma as the subject A tribute to the completeness of his research is the fact that little of note has been added to knowledge of this subject since its publication For this thesis he received an Honours M.D., with a Bellahouston gold medal for special excellence Continuing his researches, Dr Teacher was rewarded by the discovery of the earliest complete human ovum known The description of the Teacher-Bryce ovum No 1 is now a classic In 1907 he was appointed lecturer in pathological histology under Professor Muir, and two years later he received the appointment of professor of pathology at St Mungo's College Glasgow Royal Infirmary In 1911 when the new University chairs were founded in the Glasgow Royal Infirmary he became the first professor of pathology, a position which he filled with distinction till his death

During the last nineteen years of his life Dr Teacher was mainly occupied in organizing his new institute of pathology collecting around him an efficient staff, and placing on a sound and comprehensive basis the teaching of pathology at the Royal Infirmary He also created a pathological museum containing many unique and interesting specimens as well as the ordinary teaching preparations At the time of his death he was engaged in the preparation of a complete museum catalogue During the war Dr Teacher's duties multiplied enormously, for, in addition to the work arising from the almost complete depletion of his staff, he undertook many military duties involving much exposure and anxiety He felt this to be his duty as an old and enthusiastic Volunteer In 1924 a second early ovum—Teacher-Bryce No 2—was discovered and described For nearly thirty years Dr Teacher had collected, classified, and criticized innumerable preparations of gynaecological pathology, and he anticipated publishing his collected conclusions in the form of a book within the next year His untimely death will delay, but, fortunately, not preclude, this publication During last summer he attended the Annual Meeting of the British Medical Association at Winnipeg, when he made a communication, which was published in the *Journal* of November 29th (p 896) In the course of this rather strenuous visit he consulted with many leading gynaecological pathologists in the United States and Canada, exchanging views on many important and partially clarified problems in their particular specialties

Professor Teacher had many interests outside his professional life His favourite pastime was yachting and he devoted most of his leisure time in summer to this He was an active member of the Royal Clyde Yacht Club and the Clyde Corinthian Yacht Club Before the war his interest was mainly in the old 19-24 feet class, and when this class ceased to exist he compiled a historical "In Memoriam" volume, which was published in 1926 He then transferred his allegiance to the 6-metre class, taking part in the international yacht races held on the Clyde in 1928, when he sailed *Fiviola* in the winning team As recently as last summer he again participated in 6-metre racing on the American side An old Rugby player, he was president for some years of the University athletic club, and was largely responsible for the post war expansion of its activities As consulting pathologist and member of the Board of the Glasgow Maternity Hospital, he worked strenuously and whole-heartedly to increase its efficiency and to check reaction in the management of the institution He had a lifelong interest in the Marine Biological Station at Millport, stimulated originally by his association with the late Professor Young, and at his death he was a member of the Board of Management For many years he acted as pathologist to the Glasgow Royal Cancer Hospital, latterly in a consultative capacity He was a member of the Glasgow Radium Committee and of the Board of the Cancer Hospital, devoting much time and thought to the problems in connexion with the efficient application of radium therapy In politics he was an enthusiastic and uncompromising Conservative In private life Professor Teacher was singularly happy, and a wide circle of friend and acquaintances will extend their sincere sympathy to his widow

J A C B

Professor ROBERT MUIR writes I gladly avail myself of the invitation of the Editor to write about the late Professor Teacher, my friend and colleague

I came to know him first when I began work in Glasgow in 1899 At that time he was assistant in physiology to the late Professor McKendrick, and was just completing his descriptive catalogue of the anatomical and pathological specimens in the Hunterian Museum—an able work, characterized by clear description and faithfulness to detail Drawing his inspiration from his teacher, the late Professor Coats, he was interested chiefly in pathology, and on a vacancy occurring in the University department of pathology in 1903, I was glad to be able to secure his services He worked with me there, first as assistant and afterwards as lecturer on pathological histology, till he became pathologist to the Royal Infirmary, being appointed shortly afterwards to the newly founded Notman Chair of Pathology in 1911 His main interest lay in the morphological side of pathology, and his knowledge became both wide and accurate At an early period he was specially attracted by the problems of gynaecological pathology and though he published articles on various subjects, these problems constituted his main subject of research His papers on chorion-epithelioma attracted much attention,

they afford a good example of the high qualities of his work. The monograph by him and Professor Bryce on the early stages of development of the human ovum has been acknowledged as a masterpiece of its kind and is still fittingly spoken of as 'classical.' For some time before his death he was engaged on a book on gynaecological pathology. I hope this may still be published for in my opinion no one was better fitted for the task than he. His last communication, on the endometrium was made at the British Medical Association Meeting at Winnipeg.

As has been indicated Teacher's original work was mainly in pathological histology, in which field he had an unusually full command of technique. In carrying it out he spared no pains to attain accuracy and was always fully alive to the difficulties of interpretation connected with observational methods. His standard was thus exacting as regards both labour and time. His conclusions did not come easily but when arrived at were always reliable and worthy of attention.

Teacher took a keen and active interest in the students of the University both in their work and in their play and his knowledge of them and of their affairs often struck me as remarkable. He was a good friend to the athletic club and had a large share in the endeavours which led to the acquisition and equipment of the new athletic ground. As a teacher of his subject he was faithful and successful and I can testify to his excellence as an examiner. He was tactful just and considerate. A man of sterling character and generous nature upright in all his dealings and full of kindliness with no small fund of humour he was held in high esteem and affection alike by his students and his colleagues. He will be much missed in many sphere of University activity.

Professor W. BLAIR BELL writes:

I should like to be associated with any tribute that may be paid to the memory of my old friend John Teacher. Circumstance almost chance ordained that he should come to be regarded as a pathologist specially allied to obstetrics and gynaecology. His outstanding work on the physiology and pathology of the implantation of the ovum will always be classical, and it is to me a pathetic coincidence that his paper—published in the *British Medical Journal* last week, after his death—should deal with this subject and express views which I myself have always held. I understand that Teacher has left much valuable manuscript on gynaecological pathology. I sincerely trust that this will be collected and published. Teacher was to have presented the pathological aspect of ovarian tumours at the discussion on the pathology and clinical features of ovarian tumours to be held in Glasgow next April during the British Congress of Obstetrics and Gynaecology. Three weeks ago I heard he had had a breakdown and that he might not be able to fulfil this engagement. Within a few days I learned of his untimely passing. We who were his friends will miss him greatly and our special subject has lost a brilliant student of a particularly difficult aspect of it.

DAISY ANNABELLA GALE, M.D.

By the death of Dr DAISY ANNABELLA MURDOCH GALE (*nee* CLARK) at her home at Diss, Norfolk, on November 23rd Glasgow University has lost one of its most brilliant women graduates. The memoir that follows has been contributed by Dr. Elizabeth Sloan Chesser and Dr. Elizabeth Fraser Butler.

After a distinguished college career she graduated M.B., Ch.B., and B.Sc. in 1900 and was then awarded a studentship in biology at Newnham College, Cambridge. At the close of her Cambridge career Dr. Clark applied for a resident post at Macclesfield Infirmary. The Governors had advertised the post without any proviso in the matter of sex and since Dr. Clark was in their opinion the best of the applicants they offered her the post. The immediate sequel was the resignation *en bloc* of the visiting staff, there being nothing personal in this action but only the expression of opposition to women being doctors. Dr. Clark would have relinquished the appointment but she was strongly urged by the Governors and by her colleagues and teachers at her own university to take up her duties and demonstrate that a woman was capable of filling the post. With great courage she shouldered the task, remaining there for several months while the "boycott" lasted, and while newspapers and the general public fought her battle, her name appeared frequently in headlines, posters and cartoons—an experience from which she shrank with all the dislike of a sensitive nature. During this period the entire work of the hospital was left in the hands of Dr. Clark and another young house surgeon (a man). Since a deadlock had been reached in the affairs of the hospital, and she thought a sufficient protest had been made she decided to retire from the post and to commence practice in the town. The Governors reluctantly accepted her resignation and at the same time made her a gift of £100 in order to demonstrate to the world their satisfaction with the "lady doctor." This title had now become a household word in the town, and when Dr. Clark (together with Dr. Elizabeth Fraser who had consented to join her as a partner for the first difficult years) put up her brass plate it was found that there was already a large general practice awaiting her coming. There can be few instances where a doctor has found such a practice ready made and unbought—a practice comprising rich and poor, and consisting of men, women and children. The influence of this test case and Dr. Clark's masterly handling of it did a service to the future generations of women doctors which it is impossible to overestimate.

After leaving Macclesfield Dr. Clark went out to the East where she married Mr. C. Gale of Hong-Kong. She had two children, a boy and a girl; the husband and daughter survive her. During part of the war he held the post of deputy medical officer of health for Hong-Kong and did excellent service in connexion with an epidemic of cerebro-spinal meningitis, of which there were no fewer than 1,000 cases in three months. This work formed the basis of her thesis for her M.D. which she obtained with commendation in 1920. She was always interested in research and has published papers on the basal metabolic rate and other scientific subjects. In recent years she held the post of medical officer of the Carshalton maternity and child welfare centre and of the North Lambeth child welfare clinic. She resigned these posts in order to devote herself to her son who had sustained serious injuries as a result of a flying accident and who was ill for about eighteen months in hospitals and nursing homes.

During the last few months when Dr. Gale was facing the prospect of a painful death she showed the same dauntless courage and cheerfulness that characterized her through all the vicissitudes of life. Annabel Gale was an exceptional woman with a brilliant mind and a strong sense of humour. In her personality determination was united with kindness and her critical outlook was associated with an immense tolerance and charity.

The death occurred on November 20th at Seaford of Mr. T. F. HUGH SMITH, F.R.C.S., in his seventy-fifth year. The eldest surviving son of the late Henry Smith, F.R.C.S., surgeon to King's College Hospital, Hugh Smith was educated at King's College, Strand, and later entered his father's hospital. In 1877 he qualified as M.R.C.S., L.S.A., and became house-surgeon to Kings. In 1882 he became a Fellow of the Royal College of Surgeons. After a period of study in Paris and after holding the post of house-physician at Brompton Hospital he decided to take up general practice and joined the late Dr. Ashurst at Farningham, Kent. There he speedily built up a large and widespread practice which was certainly "general" in that it included every variety of work and all classes of society. And it was characteristic of Hugh Smith—a characteristic which endeared him to everyone—that whether in cottage or castle the patient of the moment was his only patient and received all the skill and care which he had to offer. He was an excellent surgeon and in his earlier years when motors had not bridged the distance between London and Farningham he found ample scope for his talents. He held the office of surgeon to the Kettlewell and Parkwood Convalescent Homes at Swanley, and was also medical officer to the Dartford Union. Hugh Smith was an active member of the British Medical Association and a former chairman of the Dartford Division.

He was twice married Seven years before he retired to Seaford he was joined in practice by his elder son, Major Sumner Hugh Smith, *M C* On his retirement in 1927 he was presented by his patients and friends with an address and a handsome cheque, the presentation being made by Sir William Hart Dyke on behalf of several hundred subscribers Hugh Smith was once described by a former assistant as "the finest G P in England" Certainly to all who knew him in and around Farningham he stood out as the very highest type of country doctor They realized his great professional skill, and they appreciated the simple sincerity and selflessness of his character With him medicine was in truth a vocation, and the reward he valued most came from the hearts rather than the pockets of his patients

---

DR THOMAS WOOD LOCKET died at Bratton, Wilts, on November 18th The son of George Locket, he was born at Mill Hill sixty-two years ago He was educated at Christ's College, Cambridge, and Middlesex Hospital, and graduated M A, M B, B Ch in 1893, afterwards becoming house-surgeon at the Royal Berkshire Hospital, Reading He then practised in Atherstone, and in 1902 settled down in Melksham, where he soon acquired a large practice From the beginning he took an active interest in the work of the British Medical Association, and was chairman of the Trowbridge Division from 1921 to 1924 He was a member of the Wilts Panel Committee and the secretary from 1913 to 1924 When he resigned the secretaryship the medical men of the county presented him with a silver salver This was a well-deserved appreciation of the good work that he had done for the profession, both as secretary and as a member of the Insurance Acts Committee, and especially of the Rural Practitioners' Subcommittee The money subscribed for the salver was more than enough, and with the balance he bought a silver cigarette box for the use of the chairman of the Division Everyone realized his thoroughness, his unfailing attention, his sound judgement, and his good nature, he was everybody's friend, and can have had no enemy Dr Wood Locket retired from practice four years ago, and took up scientific fruit growing His farm at Bratton was well known throughout the West of England, and he did a lot of useful work in promoting better methods of fruit culture He always took an active interest in Church work, and especially in the various men's societies associated with the Church, both in Wiltshire and in neighbouring counties His wife was a devoted nurse during his last long and painful illness, so much so that she tired herself out and died from an attack of pneumonia less than forty-eight hours before her husband When he was told of her death he said "There will be no one to meet her there" These, his last words, were characteristic of the man and his life Husband and wife were cremated at Bristol, and at the same time a memorial service was held at Bratton The large attendance of people of all classes and many medical men was evidence of the affection and esteem in which he was held by all who knew him

Medical Notes in Parliament.

[FROM OUR PARLIAMENTARY CORRESPONDENT]

THE House of Commons this week agreed to a resolution for increasing the Treasury loan to the Unemployment Insurance Fund It also discussed the School Attendance Bill, and the Expiring Laws Continuance Bill, in committee

On December 1st the Public Health Advisory Committee of the Labour party, and the Education Committee of the same party formed jointly a subcommittee on the health of school children, with Mr Somerville Hastings as its chairman This subcommittee will take evidence on tuberculosis, rheumatism and orthopaedics Witnesses will be heard from the Society of Medical Officers of Health The subcommittee is to report on the efficiency of examination and treatment under the school medical services It will also consider the nutrition of school children and the health of the child below school age

The Health and Housing Committee of Conservative members of Parliament discussed housing on December 1st

Physique of Recruits

Mr T SHAW, replying to Major Glyn on November 25th stated that for the recruiting year 1928-29, the latest period for which information was available, the main disabilities leading to the discharge of recruits were disease of the middle ear, defects of the lower extremities, disease of the heart, and defective vision An investigation now being carried out in the London area appeared to show that the general physical standard of the recruits actually accepted in that area was, if anything, higher than that of recruits accepted before the war He was informed by the Army medical authorities that the physical development of recruits during their first six months of training was satisfactory and that weight was put on at the depots to the average of 6½ lb Figures were not available as to the weight increase after three months' training, but both the general physical development and increase in weight were steadily and evenly progressive

Poison Gas

On November 25th Mr SHAW, replying to several members said that he could not say when finality would be reached in the research and experiments in defence against gas The work had purely defensive measures in view Every endeavour was made to ensure the strictest economy No soldiers were "gassed" at Porton in the ordinary sense of the word Volunteers averaging some six a week, underwent tests with the object of proving the efficacy of preventive and curative treatment for skin burns and of confirming the adequacy of the protection afforded by respirators The comparative effects of the poison gas on lung, animals and human beings were studied in the laboratories and by practical tests

Fatalities following Diphtheria Inoculation

Mr GREENWOOD, replying to Mr Freeman on November 27th, said his attention had been called to newspaper reports of the deaths of sixteen children at Medellin, Colombia, alleged to have resulted from the administration of diphtheria toxin instead of antitoxin, but he had no official information Mr Freeman asked if the Minister would prohibit similar operations on children in this country The Minister, in reply, said that none of the deaths from similar causes during the last few years detracted in any way from the value of the practice of the active immunization of persons shown to be susceptible to diphtheria, when undertaken with suitable safeguards He had no power to prohibit similar operations, even if it were desirable to do so Mr Smithers asked how many lives had been saved by this operation The Minister did not reply

Replying to a further question by Mr Freeman on the same day, Mr GREENWOOD said he had had inquiries made into the case of a girl of Upminster, aged 13, who died on October 2nd, 1930, following a serum inoculation against diphtheria This was an accident in private medical practice Fatalities following the prophylactic use of diphtheria antitoxin were very rare, and, save in the most exceptional cases of extreme susceptibility, the risk was negligible He had no power to interfere with the discretion of medical practitioners in the treatment of their patients

Mental Deficiency

On November 27th, in reply to Dr Tinsmanile Mr GREENWOOD stated that during the last five years the total number of mental defectives ascertained by local authorities under the Mental Deficiency Act had increased from 48,778 to 71,430—that is from 1·29 to 1·81 per 1,000 of the total population of England and Wales The ascertainment was not complete, and results varied in different areas In these circumstances it was impossible to say whether the number of defectives was increasing in proportion to the total population or to frame a conclusive estimate of the present number, but in certain areas the ascertainment by local authorities had reached 5 per 1,000

In reply to a question on November 27th, Mr GREENWOOD said that information on the success or otherwise of measures for the sterilization of mental deficients in foreign countries was received from time to time, but most of the legislation was of recent date and he was not in a position to estimate its value The issue was not one which could suitably be made the subject of a separate inquiry

Vaccination

In reply to Mr Groves on November 27th, Mr GREENWOOD said that thirteen deaths occurred among the small pox cases tabulated on page 70 of the report of the chief medical officer of the Ministry of Health for the year 1929 The deaths were distributed as follows 3 among persons successfully vaccinated, none among persons successfully revaccinated, 9 among persons unvaccinated, 1 death of a person whose vaccinal condition was doubtful

On the same date Mr FREEMAN asked Mr Greenwood whether, in view of the continued occurrence of deaths from post vaccinal encephalitis and other post vaccinal diseases notwithstanding the changes which were made in the method of vaccination on

October 1st 1929 he would consider legislation at an early date to repeal the compulsory clauses of the Vaccination Acts Mr Freeman further asserted that for many years vaccination had been a greater cause of death among children than small pox Mr GREENWOOD said he had under consideration the whole subject of vaccination but could not in present circumstances undertake to introduce legislation dealing with this question

Medical and Dental Benefit—On November 27th replying to Mr Rhys Davies Mr GREENWOOD stated that he did not consider any revision was required of the present method of charging approved societies for regional medical and dental service The services were equally available to all societies and proper recourse to them was desirable in the interests of good administration Mr Rhys Davies remarked that some societies utilized these services to a much greater extent than others causing inequalities in the charges on their funds Mr Greenwood answered that this point was sufficiently met by the payment by the society of a fee for each case referred

Change of Doctor—Mr GREENWOOD on December 1st told Mr Rhys Davies that he had come to the conclusion that he ought to modify the relevant part of the Medical Benefit Regulations so as to require a longer period to elapse before effect was given to a notice by an insured person of his desire to transfer to another insurance doctor Details of the procedure would be discussed with the representative bodies concerned as soon as possible

Inspection of Maternity Homes—Replying to Dr Bentham on November 27th Mr GREENWOOD stated that the routine inspection of voluntary maternity homes was carried out by the responsible local authorities Maternity homes which were in receipt of grants from his Department for the training of midwives were inspected periodically by a medical officer of the Department He had retained the right to instruct his officers to visit any maternity home as occasion arose

Lotteries and Hospitals—On November 26th Sir Nicholas Grattan Doyle asked the Prime Minister whether seeing the success attending the Irish lottery on behalf of the Dublin hospital he will give facilities for the passing of legislation to legalize in this country the holding of sweepstakes or lotteries in aid of London hospitals or for kindred purposes Mr RAMSAY MACDONALD I can hold out no prospect of time being found for discussion of this subject

Infant Mortality—Mr GREENWOOD in reply to the Duchess of Atholl on December 1st gave figures of the number of deaths of infants under 1 year of age per 1 000 live births in England and Wales as follows 1910 105 1913 108 1920, 80 1921 83 1922, 77 1923 69 1924 and 1925 75 1926 and 1927 70 1928 65 and 1929 74

Notes in Brief

During the first ten months of 1930 there were 831 deaths from accidents in coal mines and 3 119 persons were seriously injured *The death rate per 1 000 persons employed* was 0 86 *compared* with 0 95 for the first ten months of 1929

Replying to Mr White on November 27th Mr Greenwood said that the work of the *British Red Cross Society's clinic for* rheumatism was making satisfactory progress He was always prepared to consider any scheme put forward by local authorities or others for the treatment of rheumatism

Medical News.

PARTICULARS of the lectures and demonstrations arranged for next week by the Fellowship of Medicine will be found in our Diary of Post-graduate Courses published in the *Supplement* at page 252. Copies of syllabuses and tickets of admission can be obtained from the Fellowship 1 Wimpole Street, W 1 The list of special courses arranged for 1931 is now available

AT a meeting of the Pharmaceutical Society of Great Britain to be held at the Society's House (17, Bloomsbury Square, W C) on Tuesday December 9th at 8 30 p m, a lecture on endocrine organs will be given by Professor D M S Watson F R S, of University College London

A DINNER meeting of the Hunterian Society will be held at Simpson's Restaurant 77 Poultry, Cheapside E C, on Monday December 15th at 7 30 p m At 8 30 a discussion on puerperal infection will be opened by Dr Remington Hobbs and Mr M Oldershaw

THE next award of the Hunterian Society's medal will be made in 1932 The object of the medal is to encourage individual efforts among general practitioners in advancing the science and art of medicine The competition is open to all general practitioners resident within Great Britain, Ireland, and the Channel Islands whether Fellows of the Society or not The medal will be awarded for the best essay on some subject, chosen by each candidate within the province of medicine, surgery and midwifery All essays must be received on or before December 31st, 1931. The rules governing the award may be obtained on application to the honorary secretaries Dr D C Norris, 14 City Road, E C 2 and Mr Andrew McAllister, 79, Wimpole Street W 1

THE next election to the research scholarships of the Grocers' Company for encouraging original research in sanitary science will take place in May next The scholarships are each of the value of £300 a year, tenable for one year but renewable, together with an allowance to meet the cost of apparatus and other expenses in connexion with the work Forms of application and further information may be obtained from the clerk of the Company, Grocers Hall E C 2

THE *Portsmouth Insurance Committee* has elected a medical practitioner Dr Montague Way as its chairman and a pharmacist as its vice-chairman In returning thanks for his election Dr Way recalled the fact that in 1923 he succeeded his cousin Dr F Way, as a member of the Insurance Committee, and before that he was chairman of the Panel Committee His election indicated the excellent feeling which existed in Portsmouth between medical practitioners chemists and approved societies Harmony had always characterized the work of that committee and there was a gratifying absence of complaints submitted to the Medical Service Subcommittee in spite of the fact that the insured persons numbered about 77 000

THE November issue of *King's College Hospital Gazette* celebrates the centenary of the college It contains an interesting historical survey by Dr H Willoughby Lyle and Dr G F Still and Mr H Tyrrell Gray have collaborated in the composition of *Carmen Scholae Medicinae* "both words and music being published in this issue In addition to the centenary features the usual articles and news paragraphs are included, the whole making up an attractive production

THE Cambridge University Press is publishing this week *Lord Balfour in his Relation to Science*, a short memoir written at the request of the council of the Royal Society by Lord Rayleigh The book is limited to an account of Lord Balfour's scientific and philosophical thought and his administrative work for scientific, industrial, and medical research

THE twenty-first of Messrs J and A. Churchill's series of books on recent advances in medical and scientific subjects is on *Entomology* by A D Imms D Sc, F R S chief entomologist at the Rothamsted Experimental Station, Harpenden

THE International Exhibition of Hygiene at Dresden which was closed on October 13th, will be reopened next year from May 15th to September 30th

ON the occasion of the fiftieth anniversary of the discovery of the haematozoon of malaria a memorial tablet to A Laveran was unveiled on November 6th, in the hall of honour of the Val de Grâce Military Hospital Paris The ceremony was presided over by Dr Roux, director of the Institut Pasteur, and was attended by Mme Laveran and representatives of the Institut de France Académie de Médecine and various learned societies

THE National Homecroft Association has decided to erect a memorial to the late Dr G Vivian Poore, formerly professor of medicine at University College London and a pioneer of rural hygiene and sanitation by the establishment of an example of Dr Poore's principles of sanitation in working order If funds can be obtained it is proposed to erect a memorial cottage school on the association's settlement near Cheltenham All interested are asked to communicate with Professor J W Scott, University College, Cardiff

A BILL has been introduced into the House of Commons authorizing county councils and local authorities in distressed areas in England and Wales as determined by the Minister of Health to take such steps as they consider necessary for the provision of footwear for children under school age Similar provision may be made by local education authorities for children attending public elementary schools within their areas where, in the opinion of the Board of Education acute distress prevails These authorities are further empowered to assess the capacity of parents to pay for or contribute to the cost of footwear furnished to their children and such payment may be summarily recovered as a civil debt The measure is referred to as the Children (Provision of Footwear) Act 1930, and will continue in force until December 31st 1931.

THE current issue of the *Norsk Magasin for Laegevidenskaben* is dedicated to Dr Theodor Frolich formerly professor of paediatrics at Oslo on the occasion of his sixtieth birthday, and is devoted entirely to diseases of children

DR FRIEDRICH STOTZ of Heilbronn, the inventor of synthetic adrenaline who recently celebrated his seventieth birthday has been nominated doctor *honoris causa* by the medical faculty of Marburg University

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to ***The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W C 1***

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House Tavistock Square, W C 1, on receipt of proofs

All communications with reference to ADVERTISEMENTS, as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager

The ***TELEGRAPHIC ADDRESSES*** are

EDITOR OF THE BRITISH MEDICAL JOURNAL, Aitiology Westcent London

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc) *Articulate Westcent London*

MEDICAL SECRETARY, *Mediocera Westcent London*

The address of the Irish Office of the British Medical Association is 16 South Frederick Street, Dublin (telegrams *Bacillus, Dublin* telephone 62550 Dublin), and of the Scottish Office 7, Drumsheugh Gardens, Edinburgh (telegrams *Associate, Edinburgh*, telephone 24361 Edinburgh)

QUERIES AND ANSWERS

Myxoedema

D R asks if acroparaesthesia is a frequent complication of myxoedema and if there is any objection to giving parathyroid in the morning and thyroid in the afternoon in such a case

Aphonia in Parkinson's Disease

"P M G" writes A patient of mine, a man suffering from Parkinson's disease, periodically loses his voice for about ten days at a time Can anything be done to prevent this happening or to relieve it?

Magnesium Hyposulphite in Asthma

As numerous inquiries have reached him regarding the dosage of magnesium hyposulphite when given intramuscularly, Dr M J FENTON has written to say that he recommends 5 c cm to be given at the outset, increased to 10 c cm if necessary

Natural Labour after Caesarean Section

MR GRAHAM W CHRISTIE, L R C S Ed (Ulverston, Lancs) writes With reference to the query published on November 22nd (p 891), I can give the following instance as a suitable answer On December 9th 1928 I performed Caesarean section for a primipara, aged 23 who was admitted to hospital suffering from ante partum eclampsia She was in profound coma, was extremely oedematous, had had several fits just before admission, and had almost complete suppression of urine, which was thickly loaded with albumin She made a complete recovery Nine months ago a healthy child was born *per vias naturales* before the arrival of the doctor She is now in excellent health

DR A Z C CRESSY (Wallington, Surrey) writes in reply to the inquiry of W M I performed Caesarean section for eclampsia on February 24th 1913 I have since attended the woman in two normal confinements I reported the case in the *British Medical Journal* on October 19th, 1918 (p 433)

Income Tax.

Assessment of Practice

"A H had until January 1st, 1930, a half share in a partnership, and assumed the whole practice as from that date The past assessments have been on a cash basis How should the liability for periods subsequent to January 1, 1930, be calculated?

*** If A H and the retiring partner join in electing to have the practice regarded as ceasing at December 31st, 1929, and commencing anew the assessments for 1928-29 and 1929 30 can be adjusted to the actual profits of the firm for those years, and A H will be assessable for the last quarter of 1929-30 and for the year 1930-31 according to the profits made in his first year as a sole practitioner If that election is not made, the amount of the assessment for 1930-31 will be computed according to the amount of the profits of the firm for the year 1929 We understand that the former alternative applies In that case it is important that the basis of computation shall correctly represent the earnings of the actual year, and the cash basis —which relies for its fairness on the fact that all earnings received in cash will eventually come into the figures, though not necessarily in the correct year—is not applicable The most common way of computing the "earnings" of any particular year is to take the amount of cash received in that year and add the value of the debts outstanding at the end, and deduct the value of the debts outstanding at the beginning of that year

Expense borne by Partner

"H," with a view to improving the organization of the practice in which he has a share has purchased a small property, which is being used as a branch surgery He receives 10s per week from his firm and 3s 6d per week from the caretaker, but pays rates and taxes Can he treat these payments as professional expenses?

*** "H" receives £35 2s per annum in rents and pays £ in rates, the difference—less expenditure on repairs—represents his net income from the property, and if that amount does not exceed the amount of the net assessment under Schedule A of the property, he is not called on to pay tax in excess of what is fairly due If, however, the Schedule A assessment does exceed that income, there is some inequity, but it appears to be one for which no remedy is provided The assessment under Schedule D is on the profits of the firm, and the surgery rent is a firm's expense, the amount of which is fixed by voluntary agreement and no additional sum is deductible in respect of the same item of expense

LETTERS, NOTES, ETC

The 'Medical Register

THE Registrar of the General Medical Council (44, Hallam Street, W 1) writes I desire to remind those who find it essential to know whether a practitioner is *legally* qualified or not that in order to facilitate their work, the Council publishes an Octavo Edition of the *Medical Register*, printed on inexpensive paper and bound in boards This edition contains precisely the same names and lists as the official edition It is issued from this office at a special charge of 10s, post free, but no copies can be issued unless they are ordered and paid for prior to December 31st I shall be happy to send an order form upon application The *Medical Register* is the official publication, issued under the Medical Acts, and contains the names of all legally qualified practitioners, there is no other publication which takes its place The Council also issues each month a list of additions to and deletions from the *Register* The charge for these will be furnished upon application

Bronchitis caused by Exhaust Fumes

"FUMES" (Hampshire), in the course of a letter on the above subject, writes The experience of one of my patients, who was troubled by bronchial asthma during periods in which he was driving about in a car, and was relieved of his symptoms when he adopted other methods of travelling, has suggested to me that exhaust fumes might produce irritative bronchitis, and perhaps be the unsuspected cause of this condition in a large number of persons In my own patient the condition began four years ago, the symptoms then being cough, slight expectoration, and some dyspnoea During the winter months the patient would sometimes be confined to bed several times on account of extreme breathlessness and slight pyrexia, when his temperature had fallen to normal he would again get about in his car, though walking more than a few yards would again bring on an attack of breathlessness In the summer of 1928 he went on a motor tour, during which the symptoms became so distressing that he had to take to his bed and remain there several weeks In the summer, however, after another motor tour which had been followed by a similar exacerbation of symptoms, the patient himself discovered that his malady was always worse after a journey by car He immediately disposed of his car, and having taken to travelling by train, tram, etc, has had no return of the trouble During the past three months he has been able to walk several miles daily without suffering dyspnoea I should like to know what the fumes that caused my patient's illness are exactly are, and if there are any means of avoiding the risks which they so long subjected him

Symbols of Sex

DR G GREGORY KAYNE (Salford) writes Dr R Sydney Allison in his interesting article A family tendency to fullness of stature, obesity, and diabetes,' published in the *British Medical Journal* of November 29th (p 904), indicates males and females in the genealogical table by the symbols ♂ and ♀ respectively I have always been under the impression that ♂ was the symbol to be used for the male

Vacancies

NOTIFICATIONS of offices vacant in universities, medical colleges and of vacant resident and other appointments at hospitals will be found at pages 68, 69 70, 71 72 73, 76, and 77 of our advertisement columns, and advertisements as to partnerships assistantships and locumtenencies at pages 74 75 and 76

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 201

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine.

497 Meningeal Form of Acute Poliomyelitis

R DUPÉRIÉ (*Gaz hebd des Sci Méd de Bordeaux* September 21st, 1930 p 595), who records five illustrative cases in patients aged from 9 to 19, states that meningeal symptoms in poliomyelitis may be classified in the following three groups (1) meningeal symptoms of the prodromal or pre-paralytic stage occurring in the ordinary case of polio myelitis in the form of headache somnolence, backache painful nuchal rigidity and Kernig's sign (2) an abortive form of poliomyelitis characterized by meningeal symptoms only without paralysis, and (3) a form in which the meningeal symptoms predominate at the onset or during the course of the disease Except in epidemic times the meningeal forms of poliomyelitis are commonest in older children adolescents or adults They are distinguished from tuberculous meningitis by their sudden onset the predominance of spinal symptoms such as nuchal rigidity, Kernig's sign and pain in the back and limbs, and absence of cerebral symptoms and vasomotor changes The cerebro-spinal fluid in these cases in the paralytic stage is clear it contains a normal quantity of chlorides and sugar Microscopical examination reveals a hyperleucocytosis in exceptional cases and principally during the first hours as an excess of polymorphonuclear cells, but more frequently up to the third day as a mixture of polymorphonuclears and lymphocytes in which the latter predominate, while after the fourth day there is an almost pure lymphocytosis The albumin in the spinal fluid is moderate or slightly increased and Pandy's reaction is positive There is no relation between the involvement of the meninges and the severity of the disease Although two of Dupérié's cases were fatal death was due to paralysis of the bulbar nuclei and not to the presence of meningitis

488 The Incubation Period of Epidemic Jaundice.

E SYLVEST (*Ugeskrift for Laeger* October 2nd, 1930, p 936) published in 1926 an account of an epidemic of sixteen cases of acute contagious hepatitis all of which could be traced to one and the same source of infection He could not however, determine the length of the incubation period in these cases, but thinks now that he has succeeded in the case of a boy, aged 8, who became ill on January 2nd 1930 On January 5th and the following days he suffered from repeated attacks of vomiting and jaundice was associated with a dark urine On January 8th, at 4 p m he was visited by a 15-year old girl who shook him by the hand, and who stayed in the house for about a quarter of an hour She did not visit him again nor come in contact with any other patient On the morning of January 26th she fell ill and suffered from attacks of shivering The temperature in the evening was 102 5° It remained raised during the following days the stools became grey the urine dark and the skin jaundiced The jaundice passed off after about ten days the urine remaining dark for some more days The point which the author wishes to emphasize is that epidemic jaundice is so highly infectious that it can be transmitted merely by the shake of the hand of a patient who has been ill for six days When such cases are admitted to hospital they should be referred to fever and not to general wards

469 Auricular Preponderance in Mitral Stenosis

I CHVARTZMAN (*Arch des Mal du Cœur* September, 1930, p 603) refers to the earlier work of Lewis and others on the electrocardiographic changes in mitral stenosis He has investigated 52 patients 44 of whom suffered from mitral stenosis either alone or combined with aortic lesions the remaining 8 patients had either enlargement of the left auricle apart from mitral disease, or congenital heart disease with right heart strain The modifications observed in the electrocardiograms were alterations in the P waves and variations of ventricular preponderance An absolutely normal P wave was found in only two patients with pure mitral stenosis and in these the lesions were minimal An increased amplitude of the P wave occurred mostly in mitral lesions when found in other conditions it was always accompanied by radiographic evidence of auricular enlargement Notched or bifid P waves were commonly also widened and occurred most markedly in Lead II It was found that alterations of form accompanied by increase in amplitude only appeared when the myocardium was severely involved Successive tracings in the same patient further showed that progressive enlargement of the P wave corresponded to improvement in the clinical condition while flattening indicated incipient or increasing myocardial insufficiency In many patients there was no preponderance of either ventricle, but if any disparity was demonstrated right ventricular preponderance was the rule In only two patients was there preponderance of the left ventricle, and in these aortic incompetence and hypertensive disease respectively were present in addition to mitral stenosis In general the appearance of right sided preponderance corresponded to a greater or less degree of myocardial insufficiency The changes in the P wave with or without evidence of right or left ventricular strain, may appear in patients sustaining auricular damage whatever its cause In these cases the significance of the tracings can only be assessed in the light of exact clinical data

500 Enlargement of the Thymus in Mumps

E ESQUIVEL (*Journ Philippine Isl Med Assoc*, August 1930, p 316) records seven cases of mumps complicated by enlargement of the thymus No x-ray examination was made but the diagnosis of thymus enlargement was based on the increased dullness on both sides of the manubrium sterni and the marked bulging on the suprasternal notch The swellings were so prominent as to attract immediate attention they were painless and not tender the skin over them was normal and there was no pitting The thymus swelling appeared with or after the swelling of the parotids lasted from three to five days, and then subsided Enlargement of the thymus does not appear to have hitherto been described as a complication of mumps

501 Diphtheria as Cause of Late Heart-block.

S BUTLER and S A LEVINE (*Amer Heart Journ* June 1930 p 592) who record three illustrative cases in patients aged 22 32, and 52 respectively, state that in a group of twenty patients with proved heart block without the usual causes such as coronary artery disease, digitalis, fever and rheumatic infection, 50 per cent gave a history of diphtheria in childhood, as compared with a history of only 6 per cent in 600 consecutive contact surgical cases The average age of the patients with a history of diphtheria was 11 years younger and their systolic blood pressure 40 mm lower, than was the case with those without such a history The authors conclude that diphtheria is an etiological factor in the development of heart block in later years They suggest that this infection, after a variable latent interval, either brings about in some way the impairment of the conduction apparatus as the sole cause of the heart block or predisposes the heart to the insidious process of sclerosis, which in the absence of diphtheria would have occurred at a later stage

Surgery.

502. Diaphragmatic Hernia.

WITH radiology diaphragmatic hernia is being increasingly recognized the symptoms offer a fairly definite syndrome S W HARRINGTON (*Surg Gynecol and Obstet* October 1930, p 504) presents complete reports of eight cases and a brief summary of thirty cases on which he has operated during the last four years The ages of the patients of whom 13 were females and 17 males, ranged between 7 months and 70 years The symptoms are often complex because of the various structures involved and depend on such factors as the amount of interference with the functions of the herniated abdominal viscera Gastric haemorrhage is not common and is usually associated with severe gastric incarceration It is caused by erosion of the mucosa at the angulation and fixation to the hernial opening or to a thoracic structure In chronic cases this erosion may progress to definite ulceration The duration of symptoms in this series was from five weeks to twenty four years, with an average of seven years The cases were divisible into two groups those in which the stomach alone was involved and those in which several abdominal viscera were complicated The first group comprised 20 cases of which 18 were of the oesophageal and 2 of the traumatic type The second group consisted of 10 cases 8 being of traumatic origin with the opening in the left diaphragmatic leaf Oesophageal hernias are usually congenital and the symptoms may begin at birth or at any time during life they are those of intermittent or progressive gastric incarceration Strangulation of the stomach due to the hernia has never been noted possibly because of the powerful musculature and rich blood supply in the gastric

wall Chronic cases often show severe secondary anaemia and rather marked loss of weight In most traumatic cases the colon is involved, this is indicated by obstinate constipation with gaseous distension of the colon, or by periodic attacks of partial or complete obstruction In mild cases of oesophageal hernia treatment may be conservative In severe cases, where the risk of serious complications is great, surgical intervention should be instituted unless contra indicated by the patient's condition This consists in replacing the herniated viscera and repairing the abnormal diaphragm atic opening Preliminary paralysis of the diaphragm by phrenicotomy is often of value, this may also be used as a palliative measure in those cases in which radical operation is contraindicated Harrington employs intratracheal ethylene gas anaesthesia, with preliminary intravenous and oral administration of sodium amytal Post-operative care is most important in cases with marked pulmonary collapse In this series 19 patients recovered from the operation and have had no recurrences There were four post-operative deaths

503 Treatment of Intrapulmonary Abscesses and Bronchial Fistulae

E Holman (*Western Journ of Surgery*, September, 1930, p 489) describes the fundamental principles underlying the treatment of intrapulmonary abscesses and persistent bronchial fistulae, and illustrates his remarks with several clear diagrams Like abscesses elsewhere, the healing of intrapulmonary abscesses depends largely on the resistance of the patient, the virulence of the infection, and on the simplicity or otherwise of the bacterial flora Abscesses caused by a single type of organism probably heal more readily than those containing several types Perhaps almost more important, however, are the mechanical principles which include efficient drainage, gradual shrinkage of the abscess cavity, and collapse of the walls, together with the re expansion of the surrounding lung tissue Whenever possible the abscess should be drained by postural treatment in bed, and treatment should be begun as early as possible to avoid thickening of the walls of the abscess Where the chest wall has to be opened for drainage, the sizes of the external and internal orifices are of importance The natural cure is by coughing away the pus, but this method loses its efficacy when there exists a widely patent fistula The author discusses the various methods which have been adopted in the attempt to close persistent bronchial fistulae, and advocates extensive mobilization of the chest wall by resection of the ribs over the underlying cavity, together with the removal of neighbouring ribs Relaxation of the fibrous tissue lining the cavity is absolutely necessary to ensure cicatricial closure of the open bronchus

504 Cavernous Haemangioma and Trauma

J G Downing and G K Mallory (*Arch Derm and Syph*, September, 1930, p 414) report a case of haemangio endothelioblastoma occurring after trauma in a patient previously free from skin lesions, the condition developed exactly in the injured areas A man, aged 35, was rendered unconscious by a shell explosion, to find, upon recovery, his neck, face, and shoulders bandaged, upon removal of the dressings the left side of his face, neck, and shoulder was covered with crusts and serous fluid The abrasions healed rapidly, but the shoulder always showed signs of injury, and the neck and shoulder felt stiff and occasionally painful on movement About three months after the injury a deep swelling developed on the left side of the neck, and subcutaneous purplish areas and nodular swellings appeared at the site of the trauma On microscopical examination true tumour growth with reduplication of the endothelial lining of the blood vessels was seen Mitoses were present, and the tumour extended in papillary projections in veins, this growth and invasion being characteristic of a true tumour, its microscopic appearance placed it in the group of cavernous haemangio endothelioblastomas Cases quoted from the literature are also discussed, and a provisional classification of such tumours is given

505 Desmoid Tumours

J B Mason (*Ann of Surg*, September, 1930, p 444) reviews fifty cases of desmoid tumours treated at the Mayo Clinic from 1910 to 1929 These tumours are described as benign fibromata arising from musculo aponeurotic structures They may occur in any part of the body, but are most common in the abdominal muscles The tumour is discrete, firm, rounded, and of variable size, it may be situated subcutaneously or on the posterior surface of a muscle Desmoid tumours are liable to increase in size rapidly, due to interference with the blood supply and consequent oedema and mucoid degeneration, the larger tumours often give evidence central softening Symptoms are usually slight until the tumour is large, when pain and a dragging sensation from the weight of the tumour are felt Treatment, which must be surgical, depends for its success on the complete removal of the tumour, if strands of interfibrillar desmoid tissue are left the tumour is liable to recur in the primary site, no distant metastasis having ever been noted Radium and x ray treatment should be used as adjuncts to operation in the case of the larger tumours, and of those which have recurred In thirty five cases surgical operation was the principal method of treatment, there was recurrence in four of these

Therapeutics.

506 Bacteriophage Therapy in B Coli Urinary Infections

Despite the scepticism of certain authorities as to the value of the bacteriophage in the treatment of colibacillary infections of the urinary tract, L Michon (*Paris méd*, October 18th, 1930, p 356) maintains that this form of therapy gives quick results which are better than those obtained by other procedures, he believes that by perfecting the technique still greater effects will be attained Owing to the extreme difficulties in preparing autogenous strains of the bacteriophages stock preparations are employed Many cases of colibacillary cystitis and pyelonephritis have been thus treated, with great benefit, five of these are here recorded Though the results in cystitis are less favourable, they are nevertheless better than those following the exhibition of silver salts The failures may be partly due to the urine not having been previously rendered alkaline, a point which Sauvé has emphasized The bacteriophage should be given in the form of instillations into the bladder or renal pelvis In the first of these the bladder is emptied and then 10 c cm of the bacteriophage is instilled, this should be retained as long as possible The dose is repeated every other day until six to twelve instillations have been given In the case of instillations into the kidney the dose varies with the capacity of the renal pelvis, each should be preceded by a lavage with the same bacteriophage In some cases a single instillation will suffice, in others three or four are necessary Subcutaneous injections have never given good results, Sauvé suggests that this is due to the formation of antiphages which neutralize the bacteriophage before it reaches the lesion through the circulation Oral administration has also proved ineffective During this treatment no other medicaments, such as silver salts or urinary antiseptics, should be given Since colibacillary infections are almost always associated with digestive troubles, a strict watch should be kept on these, and a suitable regime be instituted In cases complicated by appendicitis or cholecystitis operation is indicated, the bacteriophage being used merely as an adjuvant Cure by the administration of bacteriophage is not to be expected when the infection is secondary to vesical stasis (prostatic enlargement, etc), to pelvic stasis (ureteral torsion), to a calculus, or to a tumour, with the removal of such causes the infection frequently disappears spontaneously When operative measures are necessary the administration of bacteriophage serves as a palliative or expectant measure which permits surgical intervention under the most favourable conditions

507 Milk Injections for Tic Douloureux

C R Ball (*Minnesota Med*, August, 1930, p 556) has observed in a large number of cases of tic douloureux that alcohol injections and the surgical removal of nerves are not seldom followed by distressing paraesthesias, described by the patient as being sometimes worse than the original pain The tic is most commonly found in neurotic patients, and this factor must be taken into account when assessing the severity of these paraesthetic sequels It is important to remember in dealing with tic subjects that "trigger areas" of sensibility often exist, not necessarily in the area of distribution of the nerve trunk which produces the pain When injecting with alcohol the physician must endeavour to abolish sensation in the "trigger area," since these spots may shift from day to day, this is often a very difficult matter, and cases have been known where each division of the trigeminal nerve has been injected in turn in pursuit of the elusive area Ball thinks that focal infection is a doubtful factor in the etiology, for every one septic tooth removed with relief of symptoms, thousands of good ones have been sacrificed without benefit He has gradually come to the conclusion that nervous instability is the leading factor in this complaint, in common with migraine, asthma, and epilepsy, and that all these are allergic manifestations He has employed pyretotherapy, 5 c cm of sterilized milk being deeply injected into the gluteal region on four successive days, the dose is increased daily by 5 c cm or less according to the reaction

Definite fever production is aimed at and temperatures should reach 102 and sometimes 104 or 105 during and after the treatment Capsules of 0 5 to 0 75 grain of phenobarbital with 10 grains of calcium lactate are given after each meal Up to the present ten cases have been treated, all of which were of long duration and had failed to respond satisfactorily to alcohol injection In one case a single milk injection was followed by a severe febrile reaction there was great improvement The patient required no further alcohol injections, though pressure on "trigger areas continued to evoke pain, and the capsules were taken regularly The remaining nine patients remained free from pain after a varying number of milk injections in every case there were numerous trigger areas difficult to locate Ball concludes with a warning that this method of treatment is still on trial and must not be expected at present to supplant the alcohol injection of nerves

508. Serum Treatment of Typhoid Fever

J MARTIN (*Thèses de Montpellier* 1929-30 No 3), who reviews the literature and records two personal cases maintains that Rodet s serum, which is obtained by injecting horses with living cultures of the typhoid bacillus constitutes a specific treatment for the disease Its action, however, is not absolutely constant since it is essential that the treatment should be started before the temperature has reached the level of 104 and the typhoid state has set in This condition considerably restricts the application of the method, but if it is observed the best results can be obtained In many cases the serum may cut short the disease, almost always it attenuates the symptoms, reducing the number of complications and the incidence of relapses Serum sickness is a constant occurrence but is usually not sufficiently severe to contraindicate the use of the method

Disease in Childhood

509 Undulant Fever in Childhood.

ACCORDING to W TOBLER (*Jahrb f Kinderheilk* , September, 1930, p 72), previous records of undulant fever due to *Br abortus* have almost all been in persons between the ages of 15 and 50 Kling and Madsen found that by far the most frequent age period affected was 20–40 Kristensen (1928) whose youngest patient was aged 13 as the result of inquiries sent to children s hospitals was unable to discover a single case of infection in childhood Habs (1928) also states that nothing is known as to the disease attacking young children Since then, however Kling has reported a case in a child aged 8 The immunity of children from undulant fever is all the more remarkable since they are the chief consumers of milk. It is true that the milk supplied to children is usually boiled, but in many places it is given them raw Larsen and Sedgwick (1913) examined the blood of 425 children by the complement fixation test and found a positive reaction in 17 Many of these cases also gave a positive agglutination reaction but none of these children showed any signs of undulant fever Tobler now records a case of undulant fever in a girl aged 8, who was probably infected by the consumption of raw milk and cream Her resistance to infection had been diminished by chronic ear disease, which had required repeated operations The clinical picture was typical, and the agglutination test was positive for *Br abortus* (1 in 2,000) and *Br melitensis* (1 in 200) Recovery ensued after about three months illness

510 Sepsis with Leucopenia (Agranulocytosis) in Children

J A BICLER and J BRENNEMANN (*Amer Journ Dis Child* , September, 1930 p 515) report nine cases (four boys and five girls, whose ages ranged from 2 to 11) presenting strikingly the same syndrome—namely, gradual onset of sepsis fairly short course with fatal termination, fever, severe anaemia petechial haemorrhages with a low platelet count and leucopenia with a decrease in granulocytic cells Blood cultures were positive for staphylococci in three cases but negative in the others A history of frequent sore throats was usually obtained, the tonsils being enlarged in eight cases Loss of appetite, weakness, pallor, and pain in the joints were the usual initial symptoms, with a gradual increase in severity and periodic exacerbations Cardiac murmurs were present in eight cases In the later stages the temperature was always high and septic Petechial haemorrhages occurred late In the three necropsies performed the cardiac valves were found to be normal The duration of the illness varied from two to four months, being longest in the older children The anaemia was always severe, the red cells being as low as 870 000 per c mm in one case the haemoglobin percentage was invariably below 30 Moderate anisocytosis and poikilocytosis with some achromasia were the rule No nucleated red cells or megaloblasts were found Platelet counts made only in six cases were markedly reduced even as low as 4 000 The bleeding time was considerably increased The most striking feature was the leucopenia which was persistent and progressive there was a marked relative increase of the small lymphocytes The polymorphonuclear neutrophil count always fell below 12 per cent , in four cases as low as 1 per cent No other granular cells were seen The small lymphocytes numbered over 85 per cent of the total cell count No lymphoblasts were seen The differential diagnosis of aplastic anaemia aleukaemic leukaemia essential thrombopenia, malignant endocarditis pernicious anaemia, myelophthisic anaemia, and agranulocytic angina is discussed No form of treatment seemed to be of any value

511 Hysterical Amblyopia in Children.

J M ROBINSON (*Minnesota Med* September 1930 p 618) reports two cases of hysterical amblyopia in children A boy, aged 10 suddenly became blind in one eye after a sister returned from a school for the blind A fortnight later vision in the right eye was normal, while he could only count fingers with the left eye at two feet A girl, aged 12 was involved in a motor accident in which her father was killed A month later she complained of poor sight Neither patient had any objective symptoms functional tests indicated psychic disturbance, and both patients recovered completely Many authorities have referred to the considerable number of children aged from 7 to 14 who complain of dim sight A Russian writer states that 4 per cent of Russian children exhibit this amblyopia at one time or another Robinson thinks that it is as common among American school children In a consecutive series of 250 refractions 'psychic amblyopia" was the chief factor in ten cases In all refraction errors were inconspicuous and correction of these failed to produce normal vision Nine of the ten patients were girls, and two had monocular diplopia—a definite proof of hysteria The author believes that ocular manifestations predominate in children Hysterical diplopia produces curious phenomena but it can be differentiated from diplopias of true paralysis Contraction of the visual fields should arouse suspicion when organic disease and poisons such as alcohol, tobacco and quinine can be eliminated Robinson discusses the pathology of hysteria—a clinical entity which is neither imagination run riot nor malingering It is not due merely to suggestion though hysterical patients are most suggestible It is probably a defence-reaction since children are most frequently affected during school time Adults react thus to an intolerable situation Minor hysterical manifestations are especially frequent in pre adolescence If one of these children sees double in one eye alone or the visual field is concentrically or otherwise contracted, the case is almost certainly one of hysteria

Obstetrics and Gynaecology.

512. Metastasis in Cervical Cancer

FORMERLY metastases in cervical cancer were considered rare, and few cases were reported before radium therapy became general Some authorities believe that radium induces cellular embolism others attribute the increased number of metastases to the prolongation of life following radium treatment G JEANNENEY, Ch WANGERMEZ and ROSSET BRESSAND (*Gynécol et Obstét* August 1930 p 97) have collected many reports from the Bordeaux cancer centre and classify them in three categories metastases in the regional lymph nodes retrograde metastases in the vagina and vulva distant metastases due to transmission by lymphatics or veins Earlier writers held that in cervical cancer adenopathy was delayed, and only followed parametrial infiltration, Wertheim believed that adenopathy preceded such infiltration in one-third of the cases the hypogastric and sacral lymph nodes being first attacked with secondary extension to the iliac and lumbo-aortic nodes The present authors agree that these metastases are more common since the introduction of radium treatment but point out that surgery is employed in early localized cases when the chances of metastasis are very small while radium therapy is reserved usually for advanced cases, often exhibiting lymphatic infiltration Retrograde metastases have been recorded by many observers and distant metastases are always due to cancer emboli conveyed by lymphatics or veins Three French authors have recorded cases of cervical cancer inducing unilateral or bilateral metastasis in the supraclavicular lymph nodes while many examples of ovarian or vertebral metastases have been recorded The authors agree that metastasis in cervical carcinoma is rare and does not exceed 2 per cent , frequency appears to vary with the histological type, venous distal metastasis occurring

more frequently in the endodermal (adeno carcinoma) than in the ectodermal (baso- and spino-cellular) type To elucidate the question whether radium therapy increases the percentage of metastases, the present authors refer to seventy eight necropsies in which visceral metastases were found in sixteen cases Ten of these patients had not received radium therapy, while six had been so treated Other statistics show but slight disparity in the percentages of metastasis in treated and untreated cases Since the numbers of cases treated with radium exceed greatly the numbers submitted to operation, it is clear that if radium therapy induced metastasis there should be a much higher figure of metastases in the former category, especially as it includes very many inoperable cases Again, in certain cases the local cure permits latent distal metastases to develop It is possible that, rarely, massive doses or faulty application may induce embolism The authors therefore advise gentle manipulation, avoiding causes of local trauma, such as curetting and dilatation under anaesthetics, they condemn massive doses, and always treat the adjacent lymphatic area after radium therapy, even when it appears healthy

513 Anaerobic Streptococci in Puerperal Infection.

THE fact that bacteriological examinations of cases of puerperal infection are frequently negative has directed attention to anaerobes T K BROWN (*Amer Journ Obstet and Gynecol*, September, 1930, p 300) gives a report embodying the results of five years' investigation on these lines Blood and uterine cultures were incubated under aerobic and anaerobic conditions Results showed that anaerobic streptococci played a major part in puerperal infection Brown concludes that puerperal infections due to ordinary pathogenic organisms are, in most instances, introduced infections, whereas those due to anaerobic streptococci are usually endogenous The organisms probably do not live in the blood stream, but must be obtained in culture at a time when dissemination from some focus is taking place The organisms found are non haemolytic streptococci growing under anaerobic conditions, and producing gas with a characteristic foul odour They are also proteolytic, as shown by the digestion of meat media The odour of the cultures is similar to the odour noted at the bedside The pathogenicity of the organisms is apparently proportional to the proteolytic property of the organism In the twenty one fatal cases in the series twelve gave uterine cultures of anaerobic streptococci The practical method of attack against these anaerobes is to apply vaginal antiseptics Brown has used the following mixture for instillation in the vagina during labour 15 grams mercurochrome crystals, 5 c cm of tincture of iodine diluted to half strength in 500 c cm of glycerin For the past two years the mixture has been employed by Brown in all his ward cases, 7 c cm are instilled into the vagina, and the procedure is repeated about every twelve hours if labour is prolonged In waiting cases in which the membranes have ruptured before the onset of labour the same amount is injected daily Brown concludes, and quotes tables to show, that both the morbidity and mortality have been appreciably reduced by the use of this antiseptic preparation.

514 Clinical Features of Rupture of the Uterus

V LAZARENIC (*Zentralbl f Gynak*, September 27th, 1930, p 2466) remarks that in certain cases of spontaneous rupture of the uterus *sub partu* wide deviations are shown from the typical signs and symptoms He described one such case and stresses the importance of the sign which led to speedy correct diagnosis The patient was a 3 para, aged 25, who had had two living children The membranes having ruptured early in her third labour, she was given at home two intravenous injections of pituitary extract, the few weak pains which followed ceased in fifteen minutes, and she was sent to hospital During the three hours' journey a severe attack of pain was experienced, but on admission she was free from pain, shock, or signs suggesting haemorrhage The uterus was oblique, the cervix taken up, and the presentation occipito posterior No uterine contractions were noted during the ensuing eleven hours, and none was induced by two further intravenous injections of pituitary extract Laparotomy showed the placenta and half the foetus to have passed into the peritoneal cavity through a tear 12 cm long, the head and breech remaining in the utero cervical canal Bleeding, external or internal, was absent until abdominal extraction had been performed The patient recovered Indication to operation and the diagnosis of uterine rupture in this case were given solely by Hoehne's sign—the absence of uterine contractions following the intravenous injection of pituitary extract Such a sign is not present in every case of rupture of the uterus, and it is not known why this condition is associated with a varying response to injections of pituitary extract, the maintenance of placental attachment is possibly the deciding factor

Pathology.

515 Dietary Deficiencies of Milk.

J E BECKER and E V MCCOLLUM (*Amer Journ H*, September, 1930, p 503) have for several years been studying the nature of the dietary deficiencies of milk. Numerous workers have observed that when young growing rats are restricted to a diet of milk alone, development is soon arrested and anaemia develops It was found by Hart and Steenbock that the addition of copper and iron to such a diet results in prompt relief of the anaemia The authors chose as their basal diet a mixture of 60 per cent whole milk powder and 40 per cent dextrinized starch In most of their experiments they replaced part of the dextrin by a natural food, in order to find out which of the natural products employed possessed the greatest value in supplementing the deficiencies of milk The criteria studied were growth curves, reproductive behaviour, and the general progress of the animals The results indicated that on the basal diet progress was not normal, the growth curves showed a tendency to flatten out after about three months, and normal reproduction was seldom observed Of 38 diets in which milk powder was used at a 60 to 85 per cent level in combination with other substances only 24 sufficed for production of young, and only 4 for the production of fifth generation animals The supplementary substances in these cases were cooked dried beef liver (4 to 5 per cent), yeast (5 per cent), and a combination of ferric citrate and copper sulphate Recent investigations have shown that liver is rich in copper and iron Since the rats thrived so well on milk supplemented by ferric citrate and copper sulphate, six generations having exhibited normal growth and normal fertility, the authors conclude that it is the richness of liver in these two elements which makes it an effective supplement to milk

516 The Intradermal Test in the Diagnosis of Undulant Fever

C DUBOIS and N SOLLIER (*C R Soc de Biologie*, October 24th, 1930, p 191) have used the intradermal melitine test not only on patients with undulant fever, but also on healthy persons and patients suffering from other diseases Burnet's technique was followed exactly Of 10 patients with pulmonary tuberculosis, none reacted Of 10 patients suffering from various diseases, 2 gave slight reactions Of 12 patients with undulant fever, 11 reacted positively, (the remaining case was frankly negative, even though the patient was diagnosed clinically as suffering from undulant fever and his serum had an agglutinin titre of 1/500 Similar results obtained by other workers lead the authors to conclude that the intradermal test is not infallible in the diagnosis of undulant fever, and that it should not be employed to the exclusion of blood culture and agglutination, which they regard as the methods of choice The intradermal test was practised on 63 apparently healthy persons, who were, however, probably exposed to infection from time to time They comprised veterinary surgeons, shepherds, small proprietors, and agricultural workers who looked after goats and sheep infected with *Br melitensis*, of these, no fewer than 11 gave a positive reaction None of these positive reactors had to his knowledge ever suffered from undulant fever, nor were they in the incubation period of the disease, for when they were examined one to two months later all of them were in excellent health The existence of a positive skin test in the absence of clinical disease probably indicates, in the authors' opinion, the presence of a latent infection, and may therefore be expected in healthy carriers.

517 Latent Infections of Man with Brucella abortus

F A LENTZE (*Zentralbl f Bakt*, October 20th, 1930, p 36) examined the employees on a number of farms round Breslau for agglutinins to *Br abortus* Of 49 milkers, 11 agglutinated this organism to a titre of 1/120 to 1/240 or higher, of 5 persons who were occasionally employed in the cowsheds, 2 gave a similar titre, of 10 persons who drank considerable quantities of raw milk, which was proved by animal inoculation to contain living *abortus* organisms, none contained agglutinins Careful questioning revealed the fact that only one of the positive reactors had suffered from clinical illness which could be attributed to *abortus* infection On any given farm it was noticed that, if more than one person reacted, the titres recorded were generally higher than on farms in which only one reactor was found This may be taken to mean that the greater the amount of infection the larger will be the number of infected persons, and the higher their titres are likely to rise This investigation, though carried out on only a small scale, indicates that the danger of infection from milk is very much less than from contact with aborting animals, and that a considerable proportion of those who are exposed to infection do not develop clinical disease

FELAMINE BRAND SANDOZ

SANDOZ

An association of the most powerful cholagogue—pure crystallised cholic acid—and the classical biliary disinfectant—hexamine, entirely free from accessory substances

Indications

CHOLANGITIS, CHOLECYSTITIS, HEPATIC INSUFFICIENCY, HEPATIC CONGESTION, JAUNDICE, CHRONIC CONSTIPATION

Felamine is supplied in Bottles of 50 and 250 Tablets

de KUYPER'S
HOLLANDS

Distilled from genuine malt liquor with the Juniper berry added The advantage gained by distilling the berry with the spirit is the production of a preparation of Oleum Juniperi, mellow and free from irritating properties

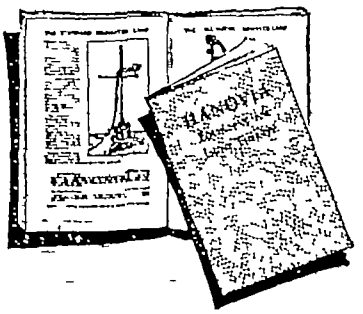
Oleum Juniperi is official in the British Pharmacopœia, and is described as carminative, anti-spasmodic, and a stimulating diuretic

In this form, therefore, the oil of Juniper can be safely taken with regularity

Distilled by the same family for 236 years

A complete catalogue . . .

. . . of the very latest development in Actinotherapy equipment



Now offered to you **FREE** *on request*

THE new prospectus issued by the Hanovia Company on equipment for light therapy is a most up-to date and complete catalogue on the subject

In its pages will be found a detailed presentation covering the whole range of equipment offered by the Hanovia Company—thirty-two pages of descriptive matter

In addition to the fullest description of this comprehensive range, details will be found of the Reference Library containing reports, papers, and text-books now in the Company's possession (A free distribution of over 100 reprints listed under their appropriate headings is also offered for the use of the Medical Profession)

For those not already familiar with actinotherapy, a short outline of its history and scope has been drawn up, followed by quotations from representative opinions on the subject The book concludes with a full description of the general service rendered by the Company to the Medical Profession

. . . send for this prospectus TO-DAY

If you are interested in or practising actinotherapy, you should not be without one of these new free books, a copy of which will be sent to you upon request to the address below Enquiries should be marked Dept 9

THE VARIOUS MODELS OF HANOVIA QUARTZ LAMPS

To Relieve Chronic Intestinal Stasis in Women

When you have a patient with chronic intestinal stasis due to diminished tonicity and stretching of abdominal muscles following a pregnancy, you will obtain excellent results from the mechanical support provided by a Spencer Belt.

Equally satisfactory results are obtained by the use of a Spencer Abdominal Belt for cases where atrophy and diminished tonicity are due to toxaemia and loss of fat following a severe illness or an abdominal operation, or in any case where enteroptosis exists

SPENCER BELT

The back of the Spencer Belt is made long enough for comfort, and to provide adequate back support.

The front of the garment curves in snugly to the pubic bone, and is so designed and adjusted that it uplifts the abdomen instead of compressing it.

Spencer Belts to relieve chronic intestinal stasis will be provided with ptosis pads if the physician desires it.

Each Spencer Belt is designed to meet the special needs of the individual who will wear it. You can therefore prescribe and obtain exactly what your patient needs

The Spencer Corsetière will call at your surgery or at your patient's home to take measurements under your supervision

Look in the telephone book under "Spencer Corsetiere", if you do not find her listed write direct to us Spencer Supports are never sold in shops.

THE SALT TRADITION

During the past 137 years—in which they have been in close co-operation with the Medical Profession and actively interested in the advances of modern surgery—the House of Salt has established a unique reputation for supplying every type of Surgical Appliance Specially made with absolute precision to each individual case, and strictly in accordance with the attending practitioner's prescription.

Such family tradition has only been achieved by the accumulated knowledge of Five Generations of the House of Salt—always co-operating with the Medical Profession and offering practical assistance by their readiness to build experimental appliances at their own expense

It is largely owing to our experience in interpreting medical requirements that our unique guarantee is rarely taken advantage of yet it is always satisfactory to know that both practitioner and patient are so adequately safeguarded

DEAF DOCTORS
AND DEAF PATIENTS

have proved "ARDENTE" a boon—a Heart Specialist whose work is so dependent on his hearing writes *"'Ardente' is a godsend to me"*, without "ARDENTE" he is, to all intents and purposes, "stone" deaf, with "ARDENTE" he carries on his work—what better testimony to "ARDENTE" merit?

Mr Dent makes a Stethoscope specially for deaf Doctors—the only one of its kind, which is widely used and praised Doctors whose work lies amongst the deaf prefer to prescribe 'ARDENTE' because they know that ARDENTE" is the only individual method in the whole deaf world (no mass production way can ever succeed with human disabilities) and they know what 'ARDENTE" service stands for to the deaf Many doctors who are deaf use "ARDENTE'

'ARDENTE' is entirely different and uncopyable and succeeds in widely differing cases A full range covers the needs of those suffering from varying forms and degrees of deafness and tinnitus Minutely adjusted to the requirements of the case for young, middle-aged or old, and so sensitive as to have the desired effect even in middle-ear and nerve cases, bringing into action and stimulating the auditory system, enabling it to function naturally and saving atrophy 'ARDENTE' can be used or not at will and is sold under guarantee.

"ARDENTE" is the choice of Doctor and patient—only after test and hearing or from prescription or particulars, is "ARDENTE' fitted toned tried, adjusted, supplied and serviced

Tests and demonstrations given at Doctors', patients or our addresses, without fee or obligation

BACILLUS COLI BACILLURIA & URINARY INFECTIONS

CONDITIONS dependent upon infection of the urinary tract by *B coli* are by no means uncommon, and present varying degrees of severity, from serious suppurative lesions of the kidney to mild bacilluria of little importance.

The mechanism of infection by *B coli* in these cases is uncertain, but it may depend upon minute lesions of the mucous membrane of the bowel through which it passes, together with probably an increase in the numbers of a particular and more virulent type (hæmolytic varieties of *B coli* are common in urinary infections in the male)

If, then, disinfection of the intestinal canal is accomplished, these forms are destroyed, and those already located in the urinary tract may be attacked by a urinary antiseptic By the combined administration of Kerol, urotropin (hexamine) and acid sodium phosphate, the treatment of urinary infections by *B coli* is placed on a rational basis, and many cases are cured by this line of treatment when they fail to yield to urotropin alone.

For intestinal disinfection, use KEROL CAPSULES (keratin-coated), they contain 3 minims of Kerol One to three capsules may be given three or four times a day after meals

STANIFORM

Regd. PLAND Trade Mark

METHYL STANNIC IODIDE

OINTMENT
Immediately stops the pain in all cases of burns scalds etc

DUSTING POWDER
For application where a greasy substance is counter indicated

LINIMENT
Remarkably effective in treatment of Rheumatoid Arthritis

LOTION
A panacea for Mosquito and other insect bites Most effective for all purposes where Tr Iodine is employed Does not stain the skin and there is no sting

TABLETS
Staniform being an organic compound is more easily assimilated than the Tin preparations at present in use

Supplies may be obtained through the Wholesale Druggists Druggists Sundriesmen or Dental Supply Companies

What the Profession says

The following are some recent unsolicited testimonials reported to the Manufacturers by Medical Men

I have treated with Staniform a very bad scald of chest in a child who had boiling water spilt over her It healed completely in fourteen days with a scar

I have tried Staniform in the Out patients Department and both Surg Staff and myself were amazed at results obtained Long standing non healing skin wounds healed after few applications

This is to certify that Staniform has been used with great success in the Emma Klinick (Utrecht Holland) in cases of bed ores in burns of heat and X rays

Similar testimony has been received from a large number of medical men when Staniform has been used for the treatment of Burns Wounds and Skin Ailments

STANIFORM is used in Leading Hospitals

STANIFORM over a wide field of clinical experience has exhibited positive curative properties Combining the well known usefulness of Tin in tuberculous coccic infections with the powerful germicidal properties of Iodine Staniform is indicated generally in local inflammations inducing an immediate effect with rapid healing

Not a doubt — Wool Protects

Medical evidence* proves wool to be one of the most absorbent of underwear materials, but it is more than that

Other materials, charged with perspiration, allow condensation on the skin at even a slight change of temperature Wool retains the moisture absorbed longer and gives it up more slowly

Dangerously quick condensation, of course, leads to clammy discomfort, worse still, to chills Wool protects against both these

In cases of rheumatism where free perspiration is essential to the elimination of uric acid, and the deposit of damp on the skin a definite risk, the need for wool is especially urgent

There is not a doubt that wool is wiser

Where you advise wool you can safely recommend Wolsey It is pure and soft and is made in a wide variety of styles and weights

DOCTORS' CHINA TEA

FOR ALL CASES OF GASTRIC TROUBLE

It is definitely not safe to allow any tea but China tea to be used when there is the slightest tendency to gastric trouble The Doctor's China Tea has no excess of Tannin whatever—it is a really good blend of China tea —it is therefore ideal as a delicious and healthful drink for all who enjoy a good cup of tea and especially for those of your patients who suffer from any form of indigestion

WHOOPING COUGH

The best practice in the treatment of whooping cough recognizes the importance of keeping the patient out of doors as much as possible The food should be easily digestible nourishing and given a little at frequent intervals
There are no specifics for this disease In very young children drugs are administered with difficulty and are of uncertain effect.
Vaporized Cresolene at night will be found a simple and effective means of preventing the paroxysms at that time thus tending to preserve the strength of the patient, avoid complications and hasten convalescence.

President LORD WAKEFIELD OF HYTHE, C.B.E. LL.D
Treasurer SIR LIONEL FALDEL PHILLIPS Bart
Physician-Supt. J. G. PORTER PHILLIPS M.D., F.R.C.P.

This Registered Hospital is now situated at Monks Orchard in some 250 acres of park pleasure and farm grounds and is ready to receive patients. Application can now be considered on behalf of patients of the educated classes in a presumably curable condition.

With a view to early treatment voluntary or uncertified patients are admitted.

Patients who can contribute 5 guineas weekly towards the cost of treatment and maintenance may be received as vacancies arise. The Committee will also consider applications for admission at lower rates and in certain cases will be prepared to admit patients free of charge.

Every facility for specialised investigation and treatment is provided in the Lord Wakefield Suite and Treatment Unit. In this Unit is found the X-ray and Dental Departments and the Bio-Chemical Pathological and Psychological Laboratories.

Further provision is made for Electro-Therapy and Hydro-Therapy to be carried out in all their forms.

In addition to the Resident Medical Staff Consultants in special branches of Medicine and Surgery are available when ever required.

The treatment of sensitive patients is greatly enhanced by the fact that the majority are given single bedrooms.

For terms and further particulars apply to the Physician Superintendent at the Hospital.

A STANLEY BRUNT
Gen Supt & Sec.
Dec. 1st 1930

INDIAN MEDICAL SERVICE

Recruitment of European Officers.

Applications are invited from medical men for permanent commissions in H.M.'s Indian Medical Service. The terms offered include a gratuity of £1,000 on retirement after six years' service, or £2,500 after 12 years' service, together with free return passages, for those who no longer desire to remain in the Service. In other respects the terms will be as detailed below.

Candidates must be British subjects under 32 years of age at the time of application and must be registered under the Medical Acts in force in Great Britain and Northern Ireland.

CAREERS

The Indian Medical Service offers wide opportunities of medical experience including *clinical preventive* specialist and research work. At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army. Promotion is on a time scale up to the rank of Lieutenant Colonel and by selection to the ranks of Colonel and Major General. An officer may apply after one year's Indian service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies which are established at the principal civil centres to provide for the medical needs of civil officials and for general medical administrative purposes; to specialist (for example public health and bacteriological) services; to research posts and to professorships at the Medical Schools.

PAY

The monthly rates of pay for European officers in the Service who have a non-Asiatic domicile are as follows:

Rank.	Service in Rank	Basic Pay	Overseas Pay	Year of Total Service.
1	2	3	4	5
		R	R	
Lieut.	—	600	120	1st
			120	2nd
			120	3rd
Capt.	(i) During first 3 years service as Captain	650	120	4th
			£15	5th
			£15	6th
	(ii) With more than 3 and less than 6 yrs. service as Captain	750	£20	7th
			£20	8th
			£20	9th
	(iii) With more than 6 years service as Captain	850	£20	10th
			£25	11th
			£30	12th
Major	(i) During first 3 years service as Major	900		
	(ii) With more than 3 and less than 6 years service as Major	1100		
	(iii) With more than 6 years service as Major	1250		
Lieut.-Col.	(i) Until completion of 23 years total service	1400	£30	13th and over
	(ii) During 24th and 25th years service	1600		
	(iii) After completion of 25 years total service	1700		
	(iv) When selected for increased pay	1850		

EXTRAS.—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service. Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service.

ANTEDATES IN COMMISSION

Any service rendered by an officer during the war as a medical or combatant officer or in a position usually filled by an officer may be counted as service for increments of pay, promotion, retirement and retired pay, but not for gratuity.

One half of any service in the ranks during the war may be counted as service for retirement and retired pay only.

Candidates possessing certain higher medical qualifications may be granted an antedate of one year in their commissions. Past service in certain hospital appointments may also render candidates eligible for an antedate of one year. Persons holding or about to hold resident posts at recognized hospitals may be seconded in those posts for a period not exceeding one year. The maximum period of antedate secondment or antedate and secondment combined admissible under this paragraph is limited to one year.

OUTFIT ALLOWANCE

Officers on appointment will receive an outfit allowance of £50.

PRIVATE PRACTICE

With the exception of Administrative Officers military or civil and officers holding certain special appointments officers are not debarred from taking private practice so long as it does not interfere with their proper duties.

LEAVE

Leave can be taken at reasonable intervals and adequate rates of leave pay are provided. Extra leave (known as study leave) which may not exceed 12 months in all during an officer's service may be granted to officers desirous of pursuing special courses of study of a post-graduate nature. During such leave study allowance at present fixed at the rate of 12s. a day in the United Kingdom, £1 a day on the Continent of Europe and £1 10s. a day in the United States of America is granted to an officer in addition to ordinary rate of leave pay.

PENSIONS

The rates of pension are as follows	Per annum
	£
After 17 years service for pension	400
18	430
19	460
20	500
21	540
22 "	580
23	620
24 "	660
25	700
26	750
27	800

These rates are subject to alteration on account of a rise or fall in the cost of living as compared with the year 1919 to an extent not exceeding 20 per cent. in all, the revision being undertaken triennially. With effect from July 1st 1929 a reduction of 5½ per cent. has been made on this account from the amounts shown.

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments.

PASSAGES.

An officer on appointment is provided with free passage to India. The wives and families of officers who are married prior to the date of the officer's embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charges.

Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service.

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately six months prior to their embarkation for India on first appointment.

Full details regarding these appointments and forms of application may be obtained from the Under-Secretary of State for India, Military Department, India Office, London, S.W.1. The Selection Committee will meet at the India Office early in January next, and the selected candidates will be required to join a course of instruction commencing early in February 1931 prior to sailing for India in the Autumn of 1931. Applications should be submitted as soon as possible.

What about taste?

MANY patients still believe innocently that the medicine must be bitter to be efficacious

Agarol Brand Compound the original mineral oil and agar-agar emulsion with phenolphthalein, is for that up to date generation that wants its medicines in the proverbial "sugar coating"

No excuses are needed for its taste any more than for its effectiveness. Agarol Brand Compound is exceptionally palatable without artificial flavouring It *flows freely* from the bottle, and can be mixed with any liquid or soft food.

Just enough mineral oil to carry unabsorbable moisture to the intestinal contents, keep them soft, and so make evacuation easy and painless. By *gentle stimulation* of peristalsis, Agarol Brand Compound makes the result certain, and aids in re-establishing regular habits

One tablespoonful at bedtime —is the adult dose

Final decision on the true worth of Agarol Brand Compound rests with the physician We will gladly send a liberal quantity with literature, for trial

AGAROL BRAND COMPOUND *for Constipation*

COW & GATE LTD. GUILDFORD, SURREY

Acute Sinusitis

may be due to

1 Vacuum—inflammatory closure of the sinus, and subsequent absorption of air,

2. Pressure of accumulated exudate,

3 Toxic influence upon nerve terminals of pus and other inflammatory products

SUCCESS in the treatment of these cases depends upon the establishment of free drainage and ventilation

Antiphlogistine applied over the affected region will help to

1st—Relieve the pain,

2nd—Dissipate the congestion,

3rd—Establish drainage of the diseased sinus

By virtue of its prolonged hyperaemic, osmotic and antiseptic powers, Antiphlogistine activates lymph circulation and relieves the swelling and congestion of the mucosa

Antiphlogistine

YOU PRESCRIBE LIGHT ABSORBENT UNDERWEAR WINTER AND

No medical man would ever recommend heavy, stuffy fabrics worn next to the skin as a protection against cold He knows that anything which fails to allow the impurities in the air round the body to escape—anything which fails to absorb perspiration—is definitely harmful Some form of light porous texture is essential for combining warmth with health And it is for that very reason that Jaeger underwear—made of Jaeger pure wool—is so often recommended as the healthiest underwear for all seasons All Jaeger underwear is replaced if it shrinks There are Jaeger Agents in every town

INVALID DIET

The high Vitamin B content of Marmite, together with its digestibility and appetising flavour, make it a most useful item in the diet of invalids and convalescents Marmite is a concentrated extract of Yeast. It is often the only form in which yeast can be tolerated by the patient

Medical Practitioners are invited to write for free sample to Marmite Limited Walsingham House, Seething Lane E.C.3.

DOCTOR'S CHINA TEA

WHY IT IS PRESCRIBED FOR GASTRIC PATIENTS

When ordinary tea is out of the question it is essential that only really good China should be drunk The Doctor's China Tea has won the enthusiastic approval of practitioners simply because it is a perfect blend of a good China leaf with all excess tannin eliminated It can therefore be prescribed for invalids and dyspeptics with safety—it has no ill after-effects

Insulin (BOOTS)

INSULIN (BOOTS) is prepared in the Laboratories of Boots Pure Drug Company Ltd, under Licence No 19 (Therapeutic Substances Act, 1925) of the Ministry of Health.
It is made from selected ox pancreas which is subject to the strictest examination before use
Th company possesses specially equipped Analytical, Pharmacological and Bacteriological Laboratories in which all the tests required by the Therapeutic Substances Act are carried out. Each batch of Insulin (Boots) is tested for potency against the International Standard Insulin and also for sterility — these tests being carried out both before and after filling into ampoules
A sample of each batch, together with a report on the potency and bacteriological tests made, are submitted to the British Medical Research Council whose certificate of correct strength and of sterility is obtained before the batch is issued

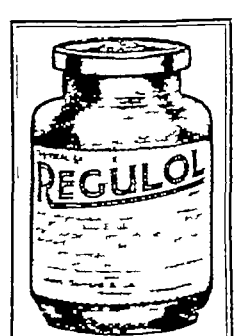
BOVRIL

There are years of recorded medical experience to confirm the value of BOVRIL as a quick stimulant and safe restorative.

The Ideal Laxative

REGULOL REGD.

REGULOL IS AVAILABLE IN TWO FORMS "PLAIN" or "COMPOUND" The latter is a combination with Phenolphthalein 4 grains per oz., and is indicated in more acute forms of Constipation where the simple lubricating effect of Paraffin is insufficient.



CUXSON, GERRARD & Co, Ltd
Oldbury, *Birmingham*

IT is a highly palatable Emulsion of Liquid Paraffin with Agar Agar, possessing all the advantages of the former without its objectionable qualities, and forming probably the best possible remedy for Chronic Constipation in Children and Adults

SAMPLE 1 lb JAR FREE ON REQUEST

Please indicate whether Plain or Compound is required

(This offer is limited to the British Isles.)

PITUITARY
(Posterior Lobe)
EXTRACT
B.D.H.

In Post-Operative Conditions

Although the principal use for Pituitary (Posterior Lobe) Extract B D H is in obstetrics, yet, on account of its pressor effect, it is employed in a variety of post-operative conditions By its stimulation of the heart and blood vessels it is of the greatest service not only in obstetrics, but also in general surgery for the prevention of post-operative shock and collapse More particularly by reason of its power to stimulate the musculature of the intestine, it is of great benefit in relieving post-operative flatulence, as well as in other conditions of intestinal stasis

Pituitary (Posterior Lobe) Extract B D H is a genuine British product which has gained a high reputation for efficacy

Every batch of Pituitary (Posterior Lobe) Extract B D H is doubly standardised—for pressor effect and for oxytocic power

PUERPERAL MORTALITY

IT is now considered that the majority of cases of puerperal sepsis are caused by the introduction of streptococci from without, during the course of labour This is a cause which should be preventable by the use of an efficient germicide

The germicide in common use in obstetrics has been lysol but it has been shown recently that the dilution of lysol which can be relied on to kill streptococci is far stronger than the tissues can stand

Considerable advantages are afforded by the use of Monsol germicide which is bland and emollient in action and, having 10 times the germicidal strength of lysol on streptococci can be safely used at a strength which ensures the destruction of these bacteria

In addition, Monsol has a particularly selective action on the strain Haemolyticus which is considered one of the principal causative agents of puerperal sepsis

Moreover the presence of organic matter affects the germicidal action of Monsol much less than that of any other antiseptic known while at therapeutic concentrations Monsol is absolutely non irritant even to mucous membranes

PYRIDIUM

TRADE MARK

In the treatment of

GENITO-URINARY DISEASES

cystitis, pyelitis,
prostatitis, epididymitis,
gonorrhoea, vaginitis, etc

ACCEPTED AMERICAN MEDICAL ASSN Council on Pharmacy and Chemistry

PYRIDIUM is the registered trade mark of the Pyridium Corporation of New York to designate its preparation of phenyl a o-alpha diamino pyridium hydrochloride

MENLEY & JAMES, LTD,
PO Box 12a, Hatton Garden, London.

Pyridium has the following characteristics and advantages :—

— 1 —

Powerful anti-bacterial action against several invading organisms particularly those of the cocci type also B Coli com.

— 2 —

Freedom from toxic effects

— 3 —

Ability to penetrate the tissues

— 4 —

Marked power of stimulation to the proliferation of epithelial cells

— 5 —

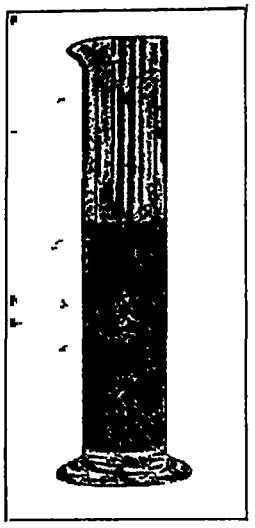
Rapid elimination through the genito-urinary tract.

— 6 —

Oral administration by means of coated tablets (each containing 0 1 gram of Pyridium)

Literature and samples on request.

MALNUTRITION and MARASMUS



Mellin's Food when given in conjunction with cow's milk and water produces an immediate gain in weight in fermentative dyspepsia and in wasting disorders of early infancy For the prematurely born infant Mellin's Food proves invaluable

As is well known, sugars exhibit varying tendencies to fermentation in the digestive organs Milk sugar ferments most rapidly, less rapidly cane sugar, and maltose still more slowly, and the high percentage of dextro-maltose in Mellin's Food accounts for its usefulness in all such cases of malnutrition

Mellin's Food

The booklet "Modified Milk in Infant Feeding" deals fully with the use of Mellin's Food in cases of malnutrition, and will be gladly sent together with samples to Members of the Medical Profession.

MELLIN'S FOOD LTD., LONDON, S.E.15.

A Showing the heavy curd formed by the action of gastric juice on ordinary cow's milk.

The 'Allenburys' DIET

A Stimulating and Sustaining Food Beverage

A solution to the problem of feeding in many acute and chronic affections is found in the use of the 'Allenburys' Diet, which presents distinct advantages over cow's milk both with regard to food value and digestibility The 'Allenburys' Diet is a palatable and highly nutritive food beverage prepared from pure fresh full-cream milk and whole wheat, and is particularly easy of assimilation It replaces with advantage milk and the milk dishes commonly employed in sickness and convalescence and can often be taken and retained where other foods are rejected As a stimulating and sustaining beverage for people of all ages, it is infinitely superior to tea, coffee etc It can be made in a minute simply by adding either boiling water or milk

In tins at 2/1, 4/- and 7/6

B Showing the finely flocculent curd formed by the action of gastric juice on the Allenburys Diet.

Descriptive literature and free clinical sample will be gladly sent on request

OVALTINE

IN NEURASTHENIA.

Every potential neurasthenic is greatly assisted by liberal drinking of Ovaltine It is recommended as a between meals beverage or as a mid-day light lunch and it displaces tea or coffee with complete advantage.

"Ovaltine is also invaluable when taken at the hour of sleep Its use in this way has often avoided the need for employing hypnotic drugs

The value of 'Ovaltine has been proved many times in such cases It provides nourishment of the right kind, and in a form readily dealt with by the impaired digestive organs 'Ovaltine permits of the liberal ingestion of food without taxing the digestive power

Ovaltine" is a complete natural food yielding in one cupful a greater food value than three eggs This delicious beverage is unquestionably a tonic nerve nutrient of a high order

A liberal supply for clinical trial sent free on request.

BY APPOINTMENT

THEY STIMULATE THE SYSTEM AND ROUSE THE APPETITE

AT THAT CRITICAL TIME WHEN SOLID FOOD CANNOT BE TAKEN

TODAY, in cases of serious illness and in convalescence, leading British practitioners find Brand's Essence an ideal restorative and stimulant A recent investigation shows that 99 *out of every* 100 doctors interviewed recommend this famous product

Containing all those valuable elements of meat which excite the gastric secretions, Brand's Essences promote the flow of these secretions and rouse them to the work of digestion instantly.

Brand's Essences are formed entirely of the pure essences of the finest fresh meats, conserved in their natural state They do not contain a particle of colouring, flavouring, or gelatine

In acute illness, they stimulate — carry the patient through the most trying periods

And in convalescence, when ordinary food is intolerable, they awaken appetite and make the patient *more responsive* to solid diet

Brand's Essences are obtainable at chemists and stores throughout the world in tins and glasses On receipt of a professional card samples of the Essences will be sent you at once Write to Dept F18, Brand & Company Limited Mayfair Works Vauxhall, S W 8

HOW GIBBS HELPS THE DOCTOR

Gibbs teaches the Golden Rule

PREVENTION IS BETTER THAN CURE

Prevention of decay is the keynote of all Gibbs advertising and propaganda Gibbs try to teach the Public to regard the loss of even one tooth as a tragedy of the first magnitude

By the constant reiteration of a few simple, wholesome precepts, Gibbs endeavour to impress strongly upon the Public the vital necessity for absolute cleanness of the mouth as a first principle in preserving the teeth Following that, any authoritative utterances by Doctors or Dentists upon any phase of teeth preservation, are given the widest possible publicity by Gibbs

The House of Gibbs welcome, at all times, suggestions from Doctors or Dentists as to any special phase of dental prophylaxis which, in the Doctor's or Dentist's opinion, should be specially emphasised at any particular time or in any particular locality

Gibbs constantly remind the Public that a little care and thoughtfulness in matters of dental hygiene is repaid a thousandfold in returns of beauty, health, happiness and business and social success

The Doctor and Dentist are always presented as the Highest Authorities upon all matters connected with the teeth Very largely as a result of Gibbs propaganda, there is an increasing acceptance upon the part of the Public, of any and all advice or instruction given by the Medical Profession.

Thus, in so far as they are able, Gibbs are working hand in hand with the Doctor and Dentist, looking forward to that day when the greater part of all dental work will be purely preventive.

GIBBS DENTURE TABLET

Gibbs new Denture Tablet is for cleaning Dental Plates, Bridgework (both gold and *vulcanite*) and artificial teeth. It gives a high polish, removes stains, makes plate or teeth sterile and antiseptic without in anyway injuring the softest gold or the finest vulcanite or platinum. The formula has been submitted to and approved by important members of the Medical Profession.

GD/Dt/12

"... colds, coughs, sore throats and influenza accounted for 43%"

(Journal of State Medicine xxxviii No 11, 649)

This extract from the report of a medical officer of a British co-education boarding school demonstrates the prevalence of these infections which frequently are precursors of more serious complications—e.g., inflammation of the ear-drum myringitis, otitis media and mastoiditis

Biological experimental evidence has established that a deficiency of Vitamin A tends to predispose to changes in the epithelial lining of the mucous tract, thus allowing for the occurrence of infection *(Brit Jour Exp Path* 1924—25 v 300), and further, that there has been found a *transformation of various epithelia into a stratified squamous keratinising epithelium* this change being *practically constant in the upper respiratory tract including the whole of the nasal passages, larynx trachea and bronchi (Lancet* April 28th 1928 881)

The regular ingestion of Radio-Malt ensures the necessary amount of Vitamin A to overcome these conditions and thus to safeguard against attacks of common cold bronchitis and other diseases of the respiratory tract whilst there are still further advantages accruing from its standardised content of Vitamins B_1 B_2 and D

PARTIAL *v.* FULL THERAPEUSIS

Magnesia and Liquid Paraffin, when properly presented, form the therapeutic complement of each other Magnesia-Oil (Musterole Brand) is superlative in its therapeutic action

The experiments of the manufacturers of Magnesia Oil (Musterole Brand) have been directed to the end of perfect pharmaceutical presentation Ordinary mixtures of Magnesia and Liquid Paraffin have a poor therapeutic value, owing to their lack of "covering" power The large globules of oil 'leak' whilst the molecules of magnesia are apt to coalesce The result is anything but the attainment of the physician's desire

In Magnesia Oil (Musterole Brand) so fine is the state of division of the Magnesia and Liquid Paraffin, that they may be said to be in close molecular companionship Therapeutically, the action of this product leaves nothing to be desired — as the maximum effect of both its components is always available through the "multiplied" activity which a state of ultra superfine division alone can give it.

MUSTEROLE **M-O** BRAND

MAGNESIA - OIL

ADVANTAGES

IT DOES NOT	IT DOES
Leak	Correct Acidity
Repeat	Adsorb Toxins

MEDULLA RUBRA

BONE-MARROW IN ANAEMIA FROM HAEMORRHAGE

W Borchardt (*Deut med Woch.*, March 28th 1930 p 521) records the results of his experiments on young dogs in which anaemia had been artificially produced by the removal of about half their blood. In the first series some of the animals were fed with rib marrow others with marrow from the long bones. Control animals received a corresponding amount either of at or of liver extract The basal diet in each case contained a sufficiency of iron (5 mg per cent). Only the animals receiving the red rib-marrow showed a definite increase of weight, and their haemoglobin formation was more rapid than that of the others. In the next series the experiment was repeated but the iron content of the diet was reduced to 1 4 mg per cent The result was similar but more striking the dogs receiving the rib-marrow regaining their haemoglobin far more quickly than the others.

THIS extract from the "Epitome of Literature," published in the 'BRITISH MEDICAL JOURNAL," dated May 3rd last, is important as representing in 1930 a complete justification of the formula upon which

Roboleine

THE FOOD THAT BUILDS THE BODY

has been produced without variation during the past twenty five years

The success of ROBOLEINE is thus due to intelligent anticipation and to consistently maintaining the highest possible standard of manufacture

Medical Practitioners are asked to satisfy themselves of the merits of ROBOLEINE, for which purpose testing samples will be gladly sent upon request.

Local Anæsthesia in Surgical Practice

CANCER OF THE CERVIX UTERI.

Typical Case

Operation Vaginal Hysterectomy

A I M, female, aged 36 years

Anaesthesia Local infiltration

History This patient had been bleeding constantly from the cervix and uterus and was in a rather critical condition The cervix presented a cauliflower growth

Technique of Anaesthesia A wide circular infiltration was made about the cervix uteri, the needle being carried well up into the broad ligaments at every stroke, and 90 c.c. of a 0 5 of 1 per cent Novocain-Adrenaline solution was used She began taking fluid immediately after operation The anaesthesia was ideal in every respect

—Extract from Practical Local Anaesthesia (Farr)

(Full technique of this and one hundred other operations under Local Anaesthesia will be found in the above work published by Henry Kimpton, 263 High Holborn, London, W C 1)

THE SAFEST LOCAL ANAESTHETIC.

BRONCHITIS, WINTER COUGH, INFLUENZA AND SEQUELÆ

There is a vast amount of evidence of the most positive character proving the efficacy of Angier's Emulsion in sub-acute and chronic bronchitis It not only relieves the cough, facilitates expectoration, and allays inflammation, but it likewise improves nutrition and effectually overcomes the constitutional debility so frequently associated with these cases Bronchial patients are nearly always pleased with Angier's Emulsion, and often comment upon its soothing, "comforting" effects

The Perfect Emulsion.

The unique soothing properties of Angier's Emulsion, its favourable influence upon assimilation and nutrition, and its general tonic effects, make it eminently useful both during and after influenza It has a well-established reputation for efficiency in relieving the troublesome laryngeal or tracheal cough, correcting the gastro-intestinal symptoms and combating the nervous depression and debility

Cod-Liver Oil

Cod Liver Oil is the richest available natural source of the fat soluble growth-promoting and anti infective vitamin *A* and the antirachitic vitamin *D*

The Allenburys "Perfected" Cod-Liver Oil is examined biologically and certified fully active with regard to Vitamins *A* and *D*

Vitamin A—Examined by the Antimony Trichloride Test it gives a colour equal to 9 Blue Units

Vitamin D—Guaranteed minimum activity of 100 units per gramme (British Standard)

In amber bottles for protection against light at 1/3 2/6 4/6 and 8/6.

Descriptive literature and a clinical sample will be sent post free on application.

Christmas and New Year Presents

From the wide range of Cases provided by BURROUGHS WELLCOME & Co this example is selected as a useful and appropriate gift for a medical man or woman

Reduced facsimile

TRADE MARK "HYPOLOID" BRAND

Hypodermic Case, No. 62

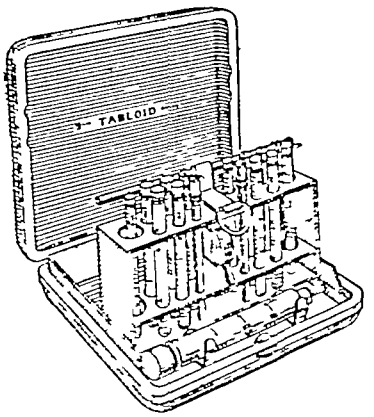
The Ideal Emergency Case

The Syringe Section is easily sterilised

Contents are firmly held in position, thus preventing breakages

When the Case is opened the 'Hypoloid' containers cannot fall out

Contents can be selected to suit the physician's individual requirements



Prices in London to the Medical Profession with standard contents, 27/6 With 'AGLA' Syringe in Spirit-tight Container and standard contents, 33/-

All Cases may be seen at the Exhibition Galleries, 10, Henrietta Street, Cavendish Square, W 1, and at the Head Office, Snow Hill Buildings, E C 1

BURROUGHS WELLCOME & CO
LONDON

COPYRIGHT

Reduced for resale

An Appropriate Gift for Your Colleague

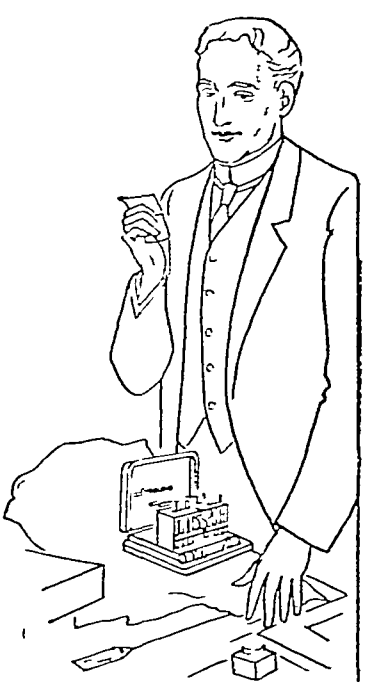
When you wish to make a present to a colleague a suitable case may be selected from the wide range of

TR DE MARK 'TABLOID' BRAND

Hypodermic Pocket-Cases

Provision is made for every requirement of general and specialised practice

The example illustrated is —



TR DE MARK 'TABLOID' BRAND

HYPODERMIC POCKET-CASE

No 23 —'Tabloid Hypodermic Pocket Case Contains an Agla Syringe two Rustless steel needles and one Rustless steel exploring needle nine tubes of Tabloid Hypodermic Products etc

Aluminium	28/0 each
Solid Silver	110/0 each

All Cases may be seen at the Exhibition Galleries 10 Henrietta Street Cavendish Square W 1 and at the Head Office Snow Hill Buildings E C 1

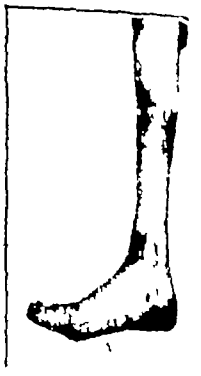
THE ORIGINAL ELASTIC PLASTER

BRITISH MADE

Elastoplast

BRITISH MADE

Patent No 253 527



Photograph shows Ulcer of 25 years duration Woman patient Age 63

ELASTIC PLASTER BANDAGES

As used in the cure of Varicose Ulcers, Varicose Veins, and for general Surgical and Orthopaedic purposes at London and Provincial Hospitals

With continuous pressure from Elastoplast, Varicose Ulcers, no matter how severe, painful, or long-standing, heal at a steady average rate of one square inch per week

After 18 weeks ambulant treatment with Elastoplast applications Bandages used—15

Also recommended for support and compression for Sprains, Strains, Dislocations, Fractures, Post-Operative Dressings, and all Orthopaedic and Surgical Purposes

METHOD OF BANDAGING FLAT FOOT, USING ELASTOPLAST

Viscopaste

Regd Trade Mark

Zinc Oxide and Gelatine Bandages

of the UNNA PASTE type, invaluable in the treatment of Varicose Vein and Ulcer complications; White Leg, Elephantiasis, Eczema, also Oedema, etc, after fracture

One introductory trial set with full details of method of treatment will be sent upon receipt of P O value 2/6 by the manufacturers

T J. SMITH & NEPHEW, Ltd., Dept B.M, 42, Tavistock Square, London, W C 1

A Paper
ON
NERVOUS AND MENTAL MANIFESTATIONS OF THE CLIMACTERIC

BY
GEORGE RIDDOCH M.D., F.R.C.P.
ASSISTANT PHYSICIAN TO THE LONDON HOSPITAL PHYSICIAN TO OUT PATIENTS THE NATIONAL HOSPITAL FOR NERVOUS DISEASES QUEEN SQUARE BLOOMSBURY

THE climacteric or involutional period is that phase of life during which the reproductive functions diminish and become finally extinct. The most obvious manifestations of it in women are the disappearance of menstruation and power of conception, but associated with it, and, in fact, forming an essential part of it, are a series of bodily and mental changes, the appearance of which frequently precedes the onset of menstrual irregularity, and which often continue for a time after menstruation has stopped. Those of them which will form the basis of this discussion are more or less transient but others are permanent, and are the hall-marks of middle age. Such are wrinkles, grey hair and a calmer, if more conservative and less romantic, outlook on life.

The majority of women pass through the climacteric with its psycho-physiological adjustments without great discomforts, and in some, who are specially favoured perhaps with a balanced natural equipment and a happy environment it hardly causes a ripple in their lives. Others however are less fortunate, and to the nervous and mental disorders which beset them special attention will be given.

Men, as well as women are compelled by nature to experience this period of involution, but in them it begins about ten years later, and on the whole the reactions are less intense. It is an easier transition, unaccompanied by flushes and other discomforts of vasomotor origin and although their waist line increases, and they lose their youthful vigour middle age is apt to be accepted more philosophically, perhaps because their interests are more diffuse and absorbing and the loss of the power of reproduction means less to them than to women. But in general, the mental and physical changes at the climacteric are of the same order in men as in women, although because of the later age at which it occurs, and the greater liability to arterial degeneration complicating psychoses more often merge into the pre-senile degenerative mental states. I propose therefore, to confine my contribution to the discussion to the nervous and mental phenomena in women at the natural climacteric and to do no more than indicate, when occasion arises features that distinguish the artificial menopause from ovariectomy in young women.

PHYSIOLOGY OF THE CLIMACTERIC

Involution is essentially a physiological process, a general reaction to ovarian deprivation. It commences, as a rule between the ages of 40 and 50, and lasts for two or three years. There is much that is yet unknown about the nature of the reaction but it is clear that the primary response is due to other endocrine glands, more particularly those that are in most intimate functional relationship with the ovaries. Of these the suprarenals, pituitary and in *particular the thyroid, play a leading part. Involved in* the reaction is the nervous system, through the autonomic or vegetative portion of it, which is delicately influenced by and in turn influences the so-called ductless glands, *especially the thyroid and suprarenals.*

From the available experimental and clinical evidence it would appear that the glandular reaction may be towards increased or diminished activity which however, is not uniform but in general varies with each gland, and also with the constitution of the individual. According to Marañon,[1] whose work ought to be studied by those who are interested in the subject, there are usually signs of overaction of the thyroid in the normal climacteric, to which, with lowered threshold of response the sympathetic nervous system may be attributed such symptoms as emotionalism, palpitations, tachycardia, sensations of discomfort in the chest, sweating, loss of weight, and occasionally goitre. Less often, manifestations of diminished thyroidal function appear, with signs of myxoedema such as lethargy, sluggish mental reactions, dryness and inelasticity of the skin, slow pulse, loss of hair, and increased sensitiveness to cold. They are more common after castration than in the natural climacteric (Marañon). My personal observations agree with those of Marañon and have led me to believe that the affective reactions at the change of life are, although other important factors come into play, the result of dysthyroidism. If the obesity of middle age can be attributed to the pituitary, this gland reacts to ovarian insufficiency more often by diminished than by excessive activity. Examples of acromegaly, however, do occur and I have at present two patients under my care at the London Hospital.

In regard to the suprarenals it has been shown by Hannan[2] and others that the flushing of the climacteric can be provoked by subcutaneous injections of small doses of adrenaline and in fact in their symptoms, resemble the reactions to adrenaline in pre-climacteric people. It is possible also that the transient hypertension and glycosuria common at the change of life are due to hyperadrenalism, a view that is held by Culbertson.[3]

The functions of the cortex of the suprarenals are still imperfectly understood but the development of masculine features in cases of adenoma of this portion of the gland may indicate that the occasional growth of coarse hair on the chin, legs, and trunk a deep voice aggressiveness, and other supposed male attributes may be due to excessive functional activity of this portion of these glands.

The physiological basis of climacteric symptomatology can therefore be said to consist of instability of certain endocrine glands and through them, of the autonomic nervous system the whole train of events being set agoing by ovarian insufficiency. This state of physiological unrest temporarily upsets the mental as well as the physical balance of the individual by giving rise to emotionalism, with a general tendency towards gloominess apprehensiveness and irritability. In all probability it is to dysthyroidism that the affective reaction is mainly to be attributed.

SYMPTOMS OF THE NORMAL CLIMACTERIC

After ovariectomy at the pre-menopausal age arrest of menstruation is the first of the train of events that follow abolition of ovarian function, but in the natural climacteric, occurring at the usual age, other symptoms and signs, notably emotionalism and flushes commonly precede menstrual irregularities, and persist for a time after menstruation has ceased. It is for this reason that Marañon[1] has rightly insisted on the recognition of three stages in the clinical picture of the climacteric (1) pre-menopausal, (2) menopausal, and (3) post-menopausal.

In briefly describing the phenomena of the normal climacteric I will mention only the more usual symptoms and signs which come within the field for discussion. Of these the most constant can be grouped under the headings of emotional instability, vasomotor reactions and change in sex feelings. As an illustration let us take the case of a married woman who has had, on the whole a healthy *life, a small well-doing family, a moderate share of difficulties,* and has dealt with them courageously and successfully. At the onset of the climacteric slight changes in temperament are noticed by the members of her family and her intimate friends. She becomes more easily worried and upset by trifles, is apt more than before to take a gloomy view of events and to be obsessed with the difficulties that crop up in ordinary domestic and social life. Phases of depression distress her, and she surprises her friends by breaking into tears for insufficient reason. She becomes irritable and fault-finding especially with her husband, children, and servants and may at times be

Read in opening a discussion in the Section of Mental Diseases and Neurology at the Annual Meeting of the British Medical Association Winnipeg 1930.

peevish and complaining, so that nothing seems to be right She appears to live in a state of mild anxiety and apprehensiveness, and will say that she does not understand what has come over her Her sleep is disturbed by flushes, dreams of domestic difficulties trouble her, and she is liable to wake early with her mind full of worries As the day goes on she improves, and by the afternoon is almost herself again In spite of it all, she manages to run her house, see her friends, and carry out her other duties in an apparently competent fashion, but she and her family feel the strain

When her periods become irregular, and in time cease, she knows that she is going through the change of life, and bears it more or less philosophically Gradually she regains her accustomed emotional balance, her flushes become less frequent, till at last, usually some time after the menopause is over, this rather disturbing crisis is passed, and peace is restored

The flushes which form so common a feature of the climacteric and act as an irritant, compelling attention to the bodily state, warrant a separate, if brief, description They occur in attacks, momentary or lasting for minutes, which vary in frequency and intensity, but are often worse in the night, probably because they are excited by warmth in bed In the longer attacks they may be preceded by headache, palpitation, or a sense of oppression in the chest, symptoms which disappear with the onset of the flush This consists of an erythema, which is distributed chiefly to the head and neck, and is accompanied by a general sensation of warmth, with or without waves of heat These waves spread rapidly In the night attacks there is often a sense of suffocation that compels the woman to sit up to breathe Flushes are often spontaneous, but may be provoked by emotional disturbance, by increase in the external temperature, or by taking food The slight attacks are much milder, and consist only of a sensation of warmth, followed by mild sweating, that gives rise to little distress

Other nervous symptoms, such as headaches, pains in different parts of the body, giddiness, and itching, either general or in the external genitals, are common and distressing enough, but are less frequent than flushes, and may be mentioned here only in passing With the flushes they are, however, important, not only on account of the physical discomfort to which they give rise, but even more because they aggravate the tendency to emotional instability the development of a fear of mental and physical disease and a gloomy outlook on life At the same time I would stress that although the phenomena just described may be looked upon as being within the limits of the normal climacteric reaction, many women pass the transition to middle age so easily that their symptoms barely disturb 'the even tenor of their way"

Factors Determining Mental Disorder

Some women, however, are harder hit, and break down mentally at the change of life Before entering upon a discussion of these complications, it would be profitable to consider the factors that appear to determine their development

Constitution and Temperament

In the first place, it will be generally agreed that a history of mental disorder in the family or in the previous life of the individual has an important bearing on the occurrence of psychoneuroses or psychoses at the climacteric She may pass through it unscathed, but the dice are set against her The odds are not easy to estimate, not only because of the difficulty, especially in the poorer classes of getting correct information about relatives with whom they may be out of touch, but also on account of the varying standards of different investigators

Emotional and Physical Background

That causation is never simple is true of all diseases, and is all the more so in mental illnesses of the kind we are considering They are reactions that are evoked by circumstances that may be mental or physical, or both, but the fact that such stimuli only occasionally precipitate an abnormal response clearly indicates the importance of individual background

The constitution as influenced by heredity is admittedly important, and from it temperament cannot be separated The emotional nervous type of woman, who has imperfectly stood up to the ordinary wear and tear of life, will be more apt to be affected adversely by the upheaval of the climacteric than the woman of more phlegmatic temperament So also educational equipment, in so far as it has led to cultivation of real interests outside herself, whether in regard to the welfare of her family or in intellectual pursuits, will help to prevent unhealthy introspection

The severity of environmental difficulties has equal significance Worry or poor health, especially prevailing the menopausal period, is apt to lead to trouble The healthy mother, happy in her family circle, or the single woman with suitable occupations and friends who satisfy her emotionally and intellectually, is likely, if of good stock, to have little trouble at the change of life

Preconceived Notions of the Climacteric

It is a popular belief that the change of life in women is associated with illness The fear that this belief engenders may lead to much unhappiness by accentuating the emotional instability natural to the climacteric Unfortunately, physicians in this respect are not entirely free from blame, for they are perhaps too inclined to forget, when discussing the climacteric, that, as a rule, it is associated with only slight disturbances Thoughtlessly they may also, as a ready means of getting out of a diagnostic difficulty, attribute symptoms which they cannot explain to the climacteric

Varieties of Mental Disorder

Mental complications may be divided into two groups (1) psychoneuroses, (2) psychoses While such a classification is justifiable, everyone with experience of abnormal mental states at the change of life will admit the difficulties in differential diagnosis, particularly between anxiety neuroses and the early phase of psychotic depression In fact, the difficulties are not limited to this field, for, looked at from the point of view of psychological reaction, the main difference in the mental manifestations of the normal climacteric, the psychoneuroses, and involutional melancholia is in essence only one of degree They are, so to speak, a continuity, differing in quantity but not in quality, with their symptomatological background of apprehension, depression, and emotional instability Essentially affective reactions, they are slight or severe according to the woman's inheritance, mental toughness and adaptability, the stresses to which she has been subjected, and perhaps also to the balance of her endocrine reaction at the climacteric The presence of delusions and hallucinations may indicate no more than an emotional disturbance of unusual severity and duration

Psychoneuroses

Anxiety, gloominess of outlook, and physical discomfort are the basic psychoneurotic symptoms which, as has been said, differ only in degree from the disturbances that can be regarded as normal at this time of life In consequence it is difficult to delimit normal reactions, but, for practical purposes, one might consider that the line has been crossed when emotionalism is persistent and severe enough to lead to more or less pronounced change in behaviour and to invalidism She has full insight, but cannot, without help, overcome her difficulties

Strictly speaking, the term "psychoneurosis" ought to be confined to those anxiety states which have been precipitated by domestic or other worries or by fear of the menopause and its consequences, and which, at the same time, do not present psychotic features Such cases, of course, occur, and differ from the anxiety neuroses of the early years only in so far as they are coloured by the significance of the menopause and its physical discomforts

All will, however, admit the difficulties of differentiating psychoneuroses from early depressive psychoses, and there can be little question but that many cases labelled

neuroses are really examples of psychotic depression either mild or at the prodromal stage

The clinical picture of the psychoneuroses at the change of life need not be described but attention might be drawn to the frequency, as in the psychoses with which thoughts and obsessions have a sexual colouring The suspicions jealousies and false accusations directed against the husband are, when without justification, due to faulty adjustment to the loss of reproductive power and ideas of diminished physical attractiveness fostered by the appearance of grey hair wrinkles, and other signs of middle age Women who are naturally suspicious, and whose marital relationships have not been felicitous for imagined or real reasons, are especially liable to develop such symptoms They thirst for attention look for slights demand concessions, become spiteful and unjust to younger women and seem to get a vicarious satisfaction in causing trouble At the same time the desire for sexual intercourse may diminish even to frigidity or it may increase or become perverted, although this is unusual

Psychoses

While the proportion of cases of serious mental disorder that can apparently have any connexion with the change of life is small in relation to the number of women who pass through the climacteric yet this period is admittedly, like puberty and pregnancy a crisis during which insanities are apt to appear in susceptible women In men the so-called involutional psychoses develop later, and are more prone for that reason, to merge into the presenile and senile psychotic states

Jones and Minague[4] have plotted a curve of incidence of insanity in women on the basis of age They found that there is a progressive rise up to about the age of 40, after which there is a short descent followed by a plateau which is continued to the age of 65 There is then a rapid rise due to senility From the statistics of the Lunacy Commissioners of England and Wales in the three years preceding 1912, Percy Smith[5] considered that the change of life was a cause or associated factor in 8·2 per cent of insanities in female patients admitted to public or private mental hospitals

Melancholia

Of the psychotic syndromes at the climacteric, melancholia is by far the most common For example in Percy Smith's series of 219 cases it formed 66 per cent Large as this proportion is it is I believe really greater, for asylum statistics do not include the majority of milder cases nor can they be relied upon to indicate the duration of the disorder, except when it is severe Admission to a mental hospital especially under certificate is delayed as long as possible—at all events in Great Britain—by relatives and family physician alike The stigma attached to it is real and cannot well be overcome until the law is altered Even then many patients requiring institutional care would be better placed in hospitals suitably equipped and staffed for dealing with those afflicted with mental illnesses in which the prognosis is good but from which patients requiring certification are prohibited Further psychiatrists like asylums come under the ban and, in consequence many patients with mild psychotic depression, who recover relatively quickly without symptoms that might demand certification come to the neurologist or general physician rather than to the psychiatrist

Apart from the frequency and duration of psychotic depression at the change of life there is the debatable question whether there is such a condition as melancholia peculiar to the climacteric and apart from manic-depressive psychosis The diagnostic difficulty lies largely in the fact that the evidence is clinical rather than pathological and that the reactions of the individual with a varying background of life history cannot be constant Nevertheless there is considerable reason for adopting the view that there is a syndrome of involutional melancholia First there is the absence of previous history of mental disorder in a large proportion of cases In Jones and Minague's series this amounted to between 70 and 80 per cent and in Percy Smith's[5] to 67 per cent Secondly, mental and physical retardation in a considerable proportion of cases of depression is relatively absent, restlessness being more common Thirdly, attacks may appear to be precipitated more often by mental and physical disturbances and so tend less to develop without apparent reason than clear manic-depressive attacks Lastly, according to the evidence put forward by Hoch and MacCurdy,[6] involutional melancholia, if severe, may run a more chronic course characterized by almost constant peevishness, hypochondria, ideas of death and poverty, and insufficiency of affect

The differences in the reactions of involutional melancholia and manic-depressive insanities may depend on constitution heredity and mental adaptability alone or there may be the additional factor of emotional responsiveness in abnormal fashion to endocrine instability such as occurs at the change of life There is this to be said in favour of the latter view although solely on clinical grounds—that depression and anxiety severe enough to be looked upon as psychotic and appearing for the first time at the climacteric, differ only in degree from reactions which may be considered normal or neurotic at this time of life

It would be out of place in a short paper to describe fully the clinical picture of involutional melancholia, but attention might be drawn to certain important features of it

In the first place, prodromal symptoms are commonly present, often in the premenopausal stage of the climacteric which from their character may lead to wrong diagnose Anxiety manifested either as vague apprehensiveness or special fear—for example, of cancer—with mild depression irritability sleeplessness headache and a sense of fatigue are frequently looked upon as neurotic, until gradually the depression becomes more severe, and delusions develop Not uncommonly the symptoms of which the patient complains most direct attention to the viscera, and she may only with reluctance admit of a morbid outlook because of the suicidal ideas associated with it Such symptoms as anorexia indigestion, constipation, breathlessness, tachycardia, and pains in different parts of the body, lead the patient to the general physician rather than to the neurologist or psychiatrist It illustrates the importance of patience and care in history-taking in diagnosis

Again as the clinical picture of depression evolves certain features tend to be outstanding It is essentially an affective reaction and although the depression may be profound and continuous there is little, if any mental impairment except when the illness becomes chronic Hypochondriacal complaints referred to imperfect functioning of the intestinal tract heart, or other organs are almost constant and delusions and hallucinations occur at some time or another in all but the milder cases Delusions tend to be associated especially with ideas of unworthiness death and poverty and are apt to have a strong sexual colouring Hallucinations of any of the special senses occur Phases of inactivity, which may amount to stupor are broken into by periods of agitation, when the patient, the picture of extreme misery wanders about aimlessly wringing her hands and appealing to God in some stereotyped phrase Impulses to strike and to use abusive and filthy language are not rare The danger of suicide is ever present and is probably greatest when the depression is less severe as at the beginning and towards the end of the illness For this reason the sufferers should never be left to themselves

In considering melancholia at the change of life it is usual to differentiate various clinical types such as simple anxiety, stuporose and delusional For prognostic reasons there is some justification for this plan if it is not too rigidly applied but as Henderson and Gillespie assert predominance of one group of symptoms over another is probably determined largely by the essential character of the individual Thus the naturally suspicious will develop ideas of reference and so on

Other Examples

Brief mention only need be made of other varieties of mental illness met with at the climacteric because of their relative infrequency compared with melancholia It is

interesting that mania is comparatively rare, even in obvious cases of cyclothymia, and is suggestive of the bias towards gloominess at the climacteric When present, it may be acute, with delusions of persecution and hallucinations *Chronic paranoid psychoses characterized* by persistent ideas of reference, without much affective change, and sexual delusions of indecent suggestions and assault, occasionally occur There is usually some degree of mental deterioration Confusional insanities, with disorientation, hallucinations, and noisy episodes, may occasionally follow extreme exhaustion or septic infection, and mental disorder, with or without polyneuritis from alcoholism, has to be kept in mind The climacteric age is also the usual period for dementia paralytica in women

PROGNOSIS

Vasomotor and nervous symptoms, including emotional *instability, tend to disappear, and with the passing* of the change of life women commonly enter a period of serenity, which has been happily termed "the autumnal peace of middle age"

The outlook in those suffering from psychoneuroses largely depends upon how far the environmental incompatibilities can be overcome, and the attitude of the woman adjusted to the disappearance of youth and reproductive *functions Domestic happiness, intellectual interests,* and physical health are invaluable assets, and much can be done by wise psychotherapy

The prospect of recovery from psychoses depends upon several factors, most perhaps on the reaction type of the illness, but also upon the physical health and general management and care of the patient

In manic-depressive states recovery is to be expected as well as in those cases of melancholia appearing for the first time in which unfavourable reactions are not present Henderson and Gillespie[7] give six to nine months as the average duration of the illness, and Hoch and MacCurdy[8] a little longer It may be shorter, and is often longer The *prognosis is worse* if agitation, delusions, and stupor are pronounced and persistent, and is largely due to the difficulty of keeping the patient sufficiently nourished

Inadequate emotional reaction, constant peevishness, narrowing of the mental horizon, auto-erotic behaviour, aimless wandering with stereotyped complaints and ridiculous hypochondriacal delusions, may appear for short *periods in benign cases, but according to Hoch* and MacCurdy, if persistent, are of bad omen

The prognosis in chronic paranoid states is grave, but in cases of alcoholic and confusional psychoses recovery will occur if the toxic cause can be eliminated

With dementia paralytica and other neurosyphilitic disorders the outlook, with treatment, is the same as in non-involutional periods of life

Whatever the mental illness may be, if it is *complicated* by cerebral arterio-sclerosis, the prognosis is worse

TREATMENT

Prophylaxis

Since poor health, *either mental or physical,* seems definitely to aggravate the psycho-physiological disturbance of the climacteric, women who are approaching this period of life should be protected as far as is possible from anxiety, and their general bodily hygiene kept at as high a level as possible At the same time, the physician should be careful to dispel dreads of illness that are so often in their minds, and help them to realize that "the change" is a normal process, *which is safely endured* by the majority of women without much discomfort

Glandular Therapy

The climacteric is an endocrine reaction to deprivation of ovarian hormones The rational treatment of those symptoms which are due to endocrinal insufficiency should therefore include active preparations of the glands which are *functionally deficient* Up to the present, however, this ideal has been only partially fulfilled, because of the want of reliable standardized preparations, except in the case of thyroid The drug market is flooded with substances which, on trial, give the most inconstant r[illegible] or none at all Nevertheless, ovarian preparations [illegible] as those of the corpus luteum, and the dry ex[illegible] the gland, are beneficial, especially for flushing and vasomotor disorders Marañon[1] considers that th[illegible] also of great help in reducing emotional instabilit[illegible] uses them, along with other measures, in the treat[illegible] of psychoneuroses and involutional melancholia

The dose advised by manufacturers is often too [illegible] and because of the variable efficacy of the different [illegible] parations the adequate dose in each case is a matter [illegible] experiment

Ovarian grafts have proved to be unsatisfactory, [illegible] perhaps, because of their rapid absorption

Thyroid is invaluable when there are signs of myxoed[illegible] but it is often used indiscriminately with harmful re[illegible] The presence of even mild hyperthyroidal symptoms, su[illegible] excitability, tachycardia, flushing, and loss of weight, is a definite contraindication, and Marañon's rule that it sh[illegible] not be given if the basal metabolic rate is higher th[illegible] +20, or the pulse rate is consistently over 100, is com[illegible] There is no special treatment for hyperthyroidal sta[illegible] during the change of life, except in so far as ovarian preparations may be considered advisable Rest, bromid[illegible] belladonna, quinine hydrobromide, and so on, are to [illegible] used as in medical treatment of hyperthyroidism in your[illegible] people

Pituitary and suprarenal preparations are sometim[illegible] employed, apparently with benefit, but I have no perso[illegible] knowledge of their effects in the climacteric

Psychotherapy

In dealing with the minor anxiety states that may co[illegible]plicate the climacteric, psychotherapy on common sense lines is unquestionably beneficial, because it helps the patient t[illegible] understand and overcome many of her fears, and so get r[illegible] of other attendant symptoms At the same time, I a[illegible] convinced that deep mental analysis, by which attempts are made to delve into unconscious processes, is not only unwarranted, but actually dangerous Believing as I d[illegible] that the essential mental changes, fear and depression, a[illegible] the emotional counterpart of endocrine upset, especially overaction of the thyroid, I would assert that it is unreasonable to hope to relieve these symptoms at the climacteric by psycho-analysis as it would be in a patient suffering from similar complaints with exophthalmic goitre The danger is more acutely realized if the view is accepted that many of the apparent psychoneuroses of the climacteric are really mild states of involutional melancholia As can well be understood, psychotherapy yields most fruitful results in cases of neurosis brought on more by fear of the change of life than when it is an abnormal psychological counterpart of endocrinal imbalance

Treatment of Psychoses

What has just been said of psychological treatment applies all the more to the psychoses occurring at the climacteric Depressed psychotic patients are often, but not always, helped by being allowed to talk freely about *their anxieties and dreads,* but the depth of the psychological disturbance prevents them from accepting [illegible] assurance Apart from general care and attention to adequate nourishment, sleep, and regulation of the bowels, much cannot be done, unless, in involutional melancholia ovarian preparations are found to be beneficial The danger of suicide in states of depression has always to be kept in mind, particularly in milder cases Full psychotics are better managed in special homes, away fr[illegible] their relatives—whether under certificate or not depends upon the circumstances in each case

IRRADIATION AND THE LEUKAEMIAS

A KEY TO MORE SUCCESSFUL TREATMENT

BY

F. A. KNOTT, M.D., M.R.C.P., D.P.H.,

HAEMATOLOGIST TO GUY'S HOSPITAL

AND

W. L. WATT, C.M.G., M.D.,

SURGEON IN CHARGE OF DEEP THERAPY DEPARTMENT GUY'S HOSPITAL.

TREATMENT of the leukaemias by deep ray therapy has several distinct advantages over the older methods of irradiation.[1] The chief of these are:

1. The danger of dermatitis is reduced to a minimum.
2. After the preliminary stay in hospital the patient can usually return to work, and need only occasionally report for examination or a short treatment, the interval in some cases being many months.
3. Patients will occasionally still respond well to deep therapy when further reduction of the white count is found to be impracticable by ordinary *x* rays.

Dosage Control

In the past dosage control has largely depended upon the rise and fall of the actual white cell count in the blood, but this was often found to be misleading since it did not explain why in some cases the effect of irradiation was beneficial from the start, while in others, with more or less identical blood counts, and subjected to exactly the same dosage, there was marked constitutional reaction, and occasionally severe delayed effects with infective complications.

The real need, therefore, has been for some more reliable guide to dosage control. With this end in view we have during the last eighteen months attempted to devise and utilize some simple and safe haematological test which would give the desired information.

In a previous note[2] we described our earlier results when directly estimating the phagocytic power of leucocytes in leukaemic patients. In the present note it is our object to indicate, from the results of controlling in this way the treatment of sixteen cases of leukaemia, the assistance which we believe can be derived from estimating the number of actively phagocytic leucocytes in the blood as compared with the total white cell count.

The Phagocytic Test

The technique of the test in its simplest form has been described in *Guy's Hospital Reports*,[3] but it is clear that, instead of observing the phagocytosis of washed staphylococci as adopted in our experiments, any suitable particulate material may be used, provided conditions are carefully standardized. If it is considered preferable to concentrate the leucocytes this may be done as in the familiar opsonic index technique or by Ponder's[4] method of causing the cells to collect on and adhere to, a clean glass slide. Whichever technique is preferred we would emphasize that the point to be determined before the patient is irradiated is the number of white cells per volume of the blood, which have when in contact with his own serum, a normal fully effective phagocytic power.

By making this estimation at the start and at intervals during treatment it seems possible to obtain direct evidence in answer to the following questions:

1. Is irradiation likely to produce undue reaction clinically or haematologically?
2. When treatment is once started how long and how strongly may it be continued?
3. What is the prospect of a good response and return to a more normal blood picture?
4. When should irradiation be repeated?

Results of Application of Test

We have recorded our results not as in the opsonic index in which the average number of organisms per leucocyte is recorded but as the percentage of cells which contain more than twenty bacteria, between twenty and ten bacteria, less than ten bacteria, and none at all. In a normal person at least 85 per cent. of the polymorphs are found to contain more than twenty cocci and extremely few are non-phagocytic. For simplicity, only the percentages of leucocytes falling in the strongly phagocytic group will be referred to in the following summary, because in practice we have found that it is necessary to consider only the percentage of polymorphs which are at any particular time phagocytically normal.

In all our cases the myeloblasts and myelocytes have been entirely non-phagocytic, and most of the immature leucocytes have been markedly deficient in this respect. We have found in each case that the number of actively phagocytic cells is lower in the haematologically more severe cases, in agreement with the generally accepted dictum that the severity of a case of leukaemia is to be judged by the percentage of immature cells present, rather than the actual increase in the total white count. As Piney[5] has pointed out, many cases of splenomedullary leukaemia contain many times the normal number of normal polymorphs, and the results of the phagocytic test fully bear this out. In early cases, with very high polymorph counts, phagocytosis may be very active but as the disease progresses the percentage of phagocytes slowly falls.

It will be generally agreed that, during irradiation of leukaemias, the most lasting results, and the most rapid initial fall in the total white count are obtained in those cases in which the percentage of frankly immature cells is relatively low. Disappointing results are most frequently associated with the more advanced and myeloblastic cases. Between these extremes many intermediate cases occur in which from clinical and haematological considerations, it is most difficult to forecast the response to irradiation treatment. In these we find the phagocytic test definitely helpful. The higher the percentage of actively phagocytic neutrophils present at the outset of, and during irradiation the more quickly does the blood picture improve and the spleen decrease in size, and the less likely is reaction to ensue.

Thus in a series of ten patients with splenomedullary leukaemia all of whom responded extremely well, suffered no significant reaction and are all following their normal occupation at the present time, the average total white cell count at the start was 208,000 per c.mm., of which 82,500 were actively phagocytic; six to nine months later the average total white count was 14,500 per c.mm., of which 7,200 were actively phagocytic. Two cases of lymphatic leukaemia, similarly tested, gave initial counts of 45,000 white cells per c.mm. (12,000 phagocytes) and 70,000 white cells per c.mm. (14,000 phagocytes) respectively; four to six months later the corresponding white counts were 25,000 per c.mm. (6,000 phagocytes) and 16,000 per c.mm. (4,400 phagocytes). It will be noted that at no time did the total phagocytic count in these cases fall to or below that met with in a normal blood—namely, about 4,000 per c.mm. It seems that during, and for some time after, irradiation a good supply of fixed and circulating phagocytes is necessary for satisfactory resolution of the tissue zones damaged by the ray, and the phagocytic test appears to be a satisfactory method of estimating this supply.

Description of Typical Cases

If we now turn to an actual summary of the first three cases of leukaemia given below, which have shown marked constitutional reaction and responded badly to deep therapy treatment, they are seen to have a relatively low phagocytic power. Case III illustrates how successful treatment of this type of case may be achieved by the use of relatively small doses of rays, and Case IV shows how the phagocytic test may give guidance as to the possibility of successful irradiation in spite of the patient's general condition being extremely bad.

CASE I.

A woman aged 50. Splenomedullary type. On September 30 h. 1929: haemoglobin 51 per cent. Total white count 13,200 per c.mm. (polymorphs 25 per cent., myelocytes 8.5 per cent., and myeloblasts 0.5 per cent.). Total active phagocytic only 420 per c.mm. After two irradiations of spleen: white count 12,800 per c.mm. with a total phagocytic count of only 350 per c.mm. Very marked reaction: vomiting, highly toxic state and marked pyrexia—maximum 104.5° F. No reduction in size of spleen. Nine injections given. Temperature slowly fell and phagocytes rose to 550. No improvement in blood count.

CASE II

A man, aged 53 Splenomedullary Total white count 120,000 per c mm At first (April 18th, 1927) good response to deep therapy, spleen reduced gain in weight, count fell to 30,000 per c mm By September 3rd, 1928, white count again rose to 105,000 per c mm and in spite of further irradiation, was still 164 000 on February 20th, 1929 No reaction occurred in 1928 during occasional irradiation, but slight fall of white count recorded after each irradiation At the beginning of 1929 a steady fall of phagocytes began, until, on November 12th, there were less than 1 000 phagocytes per c mm, and a total white count of 200,000 per c mm (myelocytes 40 per cent, polymorphs 32 per cent, myeloblasts 0 5 per cent) Spleen very large The patient at this point became markedly intolerant to deep therapy, and only medical treatment was possible subsequently He died early in 1930

CASE III

A man, aged 36, with typical splenomedullary leukaemia, was first seen on July 8th, 1929 Total white count 115,000 per c mm (myelocytes 30 per cent, polymorphs 42 per cent, nearly all phagocytic) Full doses deep therapy White count fell to 8,500 per c mm spleen much reduced (September 16th) Three months later white count again rising, and, in spite of occasional irradiation, count on March 29th, 1930, was 170 000, spleen very large, marked oedema of legs Phagocytes now only 4,000 per c mm compared with about 40,000 when first seen Subsequent irradiation produced very marked constitutional reaction, vomiting, and pyrexia A moderate fall resulted in the white count, but this immediately rose again to 120,000 Evidently response to deep therapy was beginning to fail, but by using smaller doses of deep therapy—one quarter usual size—it has been possible up to the time of writing to avoid serious reaction and to prevent the white count from rising far above 100,000, but it is impossible to bring the count down as before

CASE IV

M H aged 44 Typical splenomedullary case Total white count 400,000 per c mm (myelocytes 42 per cent, polymorphs 30 per cent) on June 14th, 1930 Marked oedema and ascites, much loss of weight, complete prostration Before admission splenic irradiation from Coolidge tube had produced reaction and some burns, so discontinued When admitted, total phagocytes 90,000 per c mm Therefore, in spite of previous reactions, it was decided to give deep therapy in full doses No reaction followed On July 12th patient walking, no oedema or ascites, spleen much reduced, white count total 100,000 per c mm, of which 60,000 were phagocytic Patient is still quite tolerant of deep therapy, and white count is remaining below 100,000 This is an example of relatively high phagocytic power as indicating the possibility of full irradiation, in spite of extremely poor initial general condition

Commentary

From these cases, taken as typical of the many now treated, we think it may reasonably be suggested that determination of the number of active phagocytes present at any given time provides definite indications as to the dosage and the prognosis in general

In the past it was customary during irradiation simply to guard against the development of a leucopenia The phagocytic test appears to be capable of providing a definitely earlier warning The total number of active phagocytes in a normal blood tested by our technique is about 4,000 per c mm, and, since adopting the rule that cases, leukaemic and others, should be irradiated very lightly, or not at all if their blood contained less than 2,000 phagocytes per c mm, no severe reactions of any kind have been encountered It is noteworthy that at the time this investigation was started five other patients were available for blood examination who were markedly intolerant to deep therapy Three responded by marked constitutional reaction, one had developed broncho-pneumonia, and one streptococcal skin lesions In each case the number of normally active phagocytes in the blood was found to be 1,000 per c mm or less

In selecting cases for treatment, observation of a good phagocytic power may allow one to discount other factors, such as poor general condition or septic complications, which might otherwise cause hesitation in applying vigorous irradiation

Extension of Method

In conclusion, it may be added that, in practice, application of this method of dosage control has not been limited to the leukaemias Since October, 1929, all cases of diffuse glandular enlargement, neoplasm, etc, for which deep therapy treatment was considered likely to be of benefit but where the general condition was not good, have been tested in this way By setting the standards described above it has been found possible to reduce constitutional reaction to a minimum, and to irradiate successfully cases which from general considerations might have been thought unlikely to tolerate the rays

Summary

1 The importance of an adequate supply of active phagocytes in the blood of a patient undergoing deep therapy treatment is emphasized

2 In leukaemia the higher the percentage of active phagocytes the better the prognosis, and the more certain then response to irradiation

3 It is suggested that the number of active phagocytes in the blood of a patient undergoing deep x ray treatment should not be allowed to fall below 2,000 per c mm

Our thanks are due to the honorary visiting staff of the Hospital for their kindness and help in permitting and facilitating the repeated examination of the various patients under observation, and especially to Dr A F Hurst, Dr F P Fraser, Dr N Mutch, Dr J A Ryle, and Dr A H Douthwaite, whose care the patients referred to were admitted

TREATMENT OF OCULAR DISEASES WITH MERCUROCHROME

BY

E R CHAMBERS, F R C S Ed, D O M S,

OPHTHALMIC SURGEON, BRISTOL ROYAL INFIRMARY

FEW medical men seem to realize what a useful drug we have in mercurochrome for certain ocular diseases It is no new drug, having been used in Bristol for the last four years, so that a vast number of cases have been treated with it My attention was first drawn to it by the fact that my surgical colleagues had proved it to be a useful antiseptic in bladder cases, and had found it practically non-irritating In our hands, in the treatment of certain eye diseases, it has proved to be a very powerful antiseptic, and the irritation caused by it in the majority of cases is negligible Its one disadvantage is its red colour, as this will stain the skin for a few days but this can be obviated if, immediately after its application to the eye, any remaining on the skin is wiped off with a cotton-wool It is used in the form of drops made of a 1 per cent solution, as an ointment of the same strength, or as a paint of a 1 or 2 per cent strength

Uses in Conjunctivitis

The drug is of service in all types, and by far the best method of treatment is to paint both lids at once with a 1 or 2 per cent solution, depending on the severity of the attack In a case seen early, this treatment is invaluable for cutting short the duration of the attack, and there is no doubt that the instillation of drops, apart from the painting of the lids, loses much valuable time For some time it has been my practice to paint these cases directly they come to me, and the results have been superior to those of any other type of treatment The best way to apply the solution as a paint is to use a fine probe, such as that employed for the nasal duct, and, after winding a very thin piece of cotton-wool round one end, dip it into a receptacle holding perhaps ten drops of the solution this prevents undue saturation of the cotton wool, and if the painting is done carefully none need get on to the patient's lids Apart from the acute cases of conjunctivitis, painting with a 2 per cent mercurochrome is also valuable in those chronic cases in which there is a good deal of velvety thickening of the conjunctiva This is the type of case that is so often beneficially treated with silver nitrate, or one of the silver compound, but we have found mercurochrome superior to silver in that the irritation is considerably less (therefore it can be applied at more frequent intervals), that it cannot damage the cornea, and that there is no danger of staining the conjunctiva even if the drug be used over a very long period It is our practice to treat this type of case in

ro paintings a week and if this does not suffice 1 per nt mercurochrome drops are given to the patient to be istilled twice a day but of late we have come to rely ore and more on the painting and to discard the drops here possible as they are certainly "messy" when used y any patient who is not careful We believe that every pe of conjunctivitis is benefited by so painting the conjunctiva for instance two cases of severe Parinaud's conjunctivitis with involvement of the cervical glands cleared p without any surgical intervention to the glands by his treatment A case of tuberculosis of the conjunctiva id excellently with this treatment combined with ultra iolet light For the last four years the maternity department of the Bristol Royal Infirmary has used a 1 per ent solution of mercurochrome instead of the usual silver itrate for instillation into the eyes of newborn babies here has been a definite decrease in the cases of ophthalmia neonatorum and now we never see those many red ve that can be produced by silver nitrate The only xception to our routine is if the parents are known to e infected with gonorrhœa, when silver nitrate is still sed All cases of ophthalmia neonatorum are now treated n the initial stages with mercurochrome drops this drug, eing non irritating can be used without fear of damage ven if there be intense chemosis and swelling of the ids In a case progressing favourably, mercurochrome ainting of the lids in the later stages is also very eneficial, but in the more severe type of case one should still rely on silver nitrate in preference to mercurochrome

Corneal Affections

Ulcers of the cornea if seen early can, with benefit be painted with mercurochrome, but too much reliance must not be placed on this drug to the exclusion of more energetic types of treatment Large phlyctenulae, or the small miliary variety, at the margin of the cornea often improve considerably with mercurochrome paint Following serious or trivial injuries to the cornea, a drop of mercurochrome into the conjunctival sac is as good an antiseptic as any

Blepharitis

This can be considerably benefited by the painting of the lids with a 2 per cent solution Before applying it all the scabs should, where possible be removed We use for this purpose a solution of warm sodium bicarbonate solution, applied gently with cotton-wool so that the underlying tissues are not damaged The edges of the lids are then thoroughly painted The results, as compared with similar treatment with such solutions of brilliant green and iodine show mercurochrome to be equally good and being so easy to apply and non irritating to the conjunctiva, we now only use it for this condition I have said that mercurochrome is non-irritating but there is apparently an exceptionally rare idiosyncrasy to the drug I have seen the occurrence only twice over a period of four years In one a patient suffered from oedematous lids, face and later chest and body He was seen by a dermatologist who considered mercurochrome to be the cause He rapidly recovered on cessation of the drug The other patient had a considerable swelling of both eyelids of the treated eye with a thin serous discharge a condition very similar to atropine irritation This cleared up rapidly on giving up the mercurochrome

Mercurochrome in Ophthalmic Surgery

As a preliminary to all eye operations, a 1 per cent solution of mercurochrome is painted over the skin of eyelids and face after the part has been thoroughly cleansed in the usual way Bacteriological investigations have shown this method to be as efficacious as painting with iodine, and no skin irritation is produced as with iodine, this fact being of some importance in eye surgery as the patient is less likely to interfere with the dressings Before operations the conjunctiva is sterilized by instilling 1 per cent drops of mercurochrome two or three times on the day before the operation, and once in the hour before the operation

With the experience of mercurochrome over the period mentioned above, we feel justified in asserting that it is really of considerable value in ophthalmology

RECTAL PARALDEHYDE AS A PRELIMINARY TO TONSILLECTOMY IN CHILDREN

BY

M SOURASKY M D Ireds F R C S Ed,

ASSISTANT SURGEON EAR NOSE AND THROAT DEPARTMENT LONDON JEWISH HOSPITAL, SURGEON EAR NOSE AND THROAT DEPARTMENT PLAISTOW CHILDREN'S HOSPITAL.

To remove tonsils and adenoids without anaesthesia is by no means a difficult task as a visit to any of the Continental clinics will prove Such a procedure has certain advantage for it obviates all risks associated with the administration of anaesthesia and also avoids the possibility of the unconscious patient being suffocated with his own blood Surgeons in this country are thankful for anaesthetics yet even with anaesthesia the removal of tonsils is no mean ordeal to a child This ordeal can be minimized considerably by a procedure which aims at "stealing" the tonsils rather than forcibly removing them Provided no complications supervene, the after-effects of tonsillectomy in children are so slight that they seem to suffer more from fear in the pre-operative stage than from discomfort after the operation These pre-operative disturbances can effectively be avoided by preliminary medication which makes the child unconscious by the time he is brought to the theatre and he is thus saved from the various stages that lead to being "put under"—a period of fear and struggle and not differing very much from that extra minute during which Continental surgeons complete the operation without anaesthesia The preliminary medication employed is the rectal administration of paraldehyde a drug which induces a condition very similar to deep sleep Given in the form of an enema whilst the child is in bed it can be administered without any struggle and without any nervous apprehension on the part of the little patient This preliminary medication has the further advantage that it necessitates very little anaesthetic and furthermore that the return to consciousness is considerably delayed although the anaesthesia itself is light By the time the child has fully recovered all the unpleasant after-effects of the anaesthetic have worn off and many children are under the impression that no operation has taken place

ROUTINE OF PARALDEHYDE ADMINISTRATION

The child is admitted the night before operation A soap and water enema is administered in the morning An hour later the bowel is washed out repeatedly if necessary, until the fluid returns clear The patient is then ready for the administration of paraldehyde per rectum This however, should only be given one hour before operation No other medication is necessary

With regard to the administration of the drug the following are important points

Dosage—The best results are obtained by the administration of one drachm of paraldehyde per stone body weight This ensures the child falling asleep rapidly in many cases before the administration of the drug is completed The sleep is sufficiently deep for the child not to waken up when carried to the theatre an hour later and it is quiet and restful

Vehicle—The paraldehyde is administered dissolved in stock solution of normal saline neither warmed nor cooled One and a half ounces of saline per drachm of paraldehyde should be used

Method of Rectal Administration—The paraldehyde solution should not be warmed before administration The cold solution must be run in slowly otherwise it will be returned. The stages in the administration are (1) Pass the catheter well lubricated into the rectum Then lightly plug anal margin with cotton wool. (2) Fill the funnel and tubing with water expelling all air and clip distal end of tubing (3) Connect to the catheter release the clip and run in the solution very slowly This procedure should take at least ten minutes The paraldehyde solution should be vigorously shaken before refilling the funnel to ensure solution (4) When all the solution has been run into the rectum the catheter is removed leaving the wool packing in place A pad of wool is placed on the perineum the nates are strapped together and the child is made to lie on his back with his legs together Sleep always supervenes within half an hour

A child thus prepared need little anaesthetic, though no child is sufficiently comatose to be able to dispense with

the anaesthetic altogether Owing to the synergic action of drugs a small quantity of anaesthetic produces very disproportionate effects Open ether is safe, and the best anaesthetic Very little is required (about one ounce) to make the child ready for the operation, the anaesthetic is taken without much struggle

All children wake up whilst they are having cold douching after the operation, but though conscious they do not remember afterwards what has happened They fall asleep as soon as they are put to bed This sleep is prolonged and restful, it lasts between eight and sixteen hours, they wake up quite refreshed

Difficulties and Dangers

Pre-operative Preparation —It is possible that the pre-operative preparation need not be so strict in the complete washing out of the rectum preliminary to the administration of the paraldehyde Experience may prove castor oil, the night before, sufficient preparatory treatment, but, in view of the fact that paraldehyde may act as an irritant of the rectum, and that a loaded colon would interfere with the absorption of the drugs, it was deemed advisable to have the pre-operative treatment as thorough as possible

Dosage —A dose of one drachm of paraldehyde per stone body weight was employed in the last 572 cases In a first series of 82 cases only half a drachm per stone weight was used This had definite disadvantages, for not only did it fail to induce satisfactory hypnosis, but it also seemed to act as an exciting agent The sleep induced was light, the child was irritable, easily wakened, and would waken up when taken to the theatre The administration of the anaesthetic would provoke a struggle, and after operation there would follow an exceedingly restless sleep lasting for four to six hours With such a dose there seemed to be no effect on the pupils, respiration was unaffected, but blood pressure was raised A dose of three-quarters of a drachm per stone weight was tried out in a second series of 146 cases The results obtained were a great improvement on those obtained with the smaller dose The sleep, though deeper, was not sufficiently deep to prevent some of the children waking up when taken to the theatre Struggling during the administration of anaesthesia was never very marked The sleep after operation lasted for four to eight hours, but, as with the smaller dose, there was a distinct tendency towards restlessness With this dosage the pupils tend to become contracted, and the blood pressure is raised A dose of a drachm per stone body weight has no dangers, as shown by the last 572 cases, and has definite advantages The sleep is deep, there is no restlessness before or after the operation, and hardly any struggling during the administration of the anaesthetic With the full dose sleep lasts for eight to sixteen hours, the pupils are contracted respiration is quiet, there is, however, a fall of blood pressure two or three hours after the operation

Vehicle —The paraldehyde should be dissolved in normal saline neither heated nor cooled, and this solution is to be run into the rectum The solubility of paraldehyde is 1 in 10 at 0° C , it is less at higher temperatures, and over blood heat the paraldehyde tends to evaporate Hutchison reports a case of considerable sloughing of the rectal mucosa owing to the administration of half an ounce of paraldehyde But he injected it in a highly concentrated form (the pure drug) "along with three or four times its volume of water"

Difficulties in the Rectal Administration —An unsuccessful rectal administration leads to the evacuation of the paraldehyde and failure of the attempted medication Extreme slowness in the running in of the solution is an essential condition for success Retention is further aided by strapping the nates together, in addition to putting a pad over the perineum It is advisable to have a nurse who has had some experience in the administration of solutions per rectum

Anaesthesia —As already pointed out, the quantity of anaesthetic is small, and the preliminary medication ensures a maximum effect considering the amount of the anaesthetic employed Open ether has been found safe, it has also the advantage of raising the blood pressure, thus counteracting the fall that the full dose of paraldehyde produces Ethyl chloride is also safe, though a needlessly large dose may be administered should the child struggle Chloroform would, however, seem to be highly dangerous On one occasion, when ten children were being operated upon, all of them were given chloroform on top of the full dose of paraldehyde In two cases there was severe collapse, the children turning greyish in colour, the pulse was rapid and thready, and the breathing was shallow Chloroform has not been tried again With ether the anaesthesia need be very light The combined effects of the paraldehyde and ether, though producing complete narcosis and anaesthesia, is sufficiently light for the reflexes to persist It is undesirable and unnecessary to push ether to the stage of abolishing the reflexes

Complications —In this series of 800 cases there were no complications that could be ascribed to the paraldehyde In one case there was some slight bleeding after the operation No active interference was necessary apart from swabbing out the throat In another case the administration of the paraldehyde was unsuccessful The child was unconscious on the table, was vomiting, and was difficult to anaesthetize There was no apparent reason for this failure, though it is worth noting that this child was one of the earlier cases, and had not received the full dose of paraldehyde Paraldehyde has an offensive odour this seems to be more troublesome to the attendants than to the patients

Disadvantages

The advantages of preliminary medication are real enough, this is well illustrated by the attitude of the little patients A child operated upon without preliminary medication fears and mistrusts the surgeon when he attempts to examine the throat after the operation but children who have had paraldehyde show no such fear and mistrust The majority readily open their mouths, and do not hinder the examination Disadvantages, however, are none the less just as real and genuine Preliminary medication implies considerable extra nursing for not only are there extra duties before the operation but more alertness is required from the nurse owing to the prolonged sleep of the children There is also the disadvantage that the extra preparations throw some strain on the child an enema, a wash out, and rectal paraldehyde are rather trying to any patient Finally, there is the disadvantage that the preparations imply in patient treatment While this is all for the good of the child, it does, unfortunately, present a serious problem at this time, when the accommodation for tonsillectomy cases is so woefully inadequate

The observations recorded here were carried out at the Plaistow Children's Hospital and at the London Jewish Hospital It is a pleasure to acknowledge my indebtedness to Mr W M Mollison of Guy's Hospital for suggesting this work, and for his kindly interest and criticism

AMIDOPYRIN IN THE TREATMENT OF MEASLES

BY

G W RONALDSON, M D , D P H ,

SENIOR ASSISTANT MEDICAL OFFICER, EASTERN HOSPITAL, L C C ,

AND

J I COLLIER, PH D , A I C , M R C S

Since 1924, when Loewenthal[1] published his paper on the value of amidopyrin in the treatment of measles, occasional short notes on this treatment have appeared in various foreign journals, but English writers have paid little attention to the use of this therapeutic agent One of us (G W R) tried the drug in a few cases of measles but possibly on account of the fact that the cases were in a late stage of the disease the results did not appear sufficiently striking worthy to merit publication In October, 1929, Horder[2]

Chicago[1] who has been using this drug for a number of years, reported very favourably on its value in measles. In June of the present year, J. I. Collier[2] recorded the results of its use in general practice during 1929 and since the appearance of his article several practitioners have contributed letters on the subject to the correspondence columns of the *British Medical Journal*. The consensus of opinion has been entirely in favour of the use of amidopyrin, and indeed, some rather extravagant claims based on the experience of a small number of cases have been made for this method of treatment. In order to secure a more thorough test of the method, arrangements were made for the treatment to be carried out on a series of cases in hospital, where the facilities for observation and treatment are better than those existing in general practice. The present paper is a survey of the results in 150 cases treated during the past winter by the staff of the Eastern Hospital. At the outset an endeavour was made to secure early cases, our intention being to make a comparison with a corresponding number of untreated cases; but it was soon found that the number of patients admitted in an early stage of the disease was too small to allow of any satisfactory investigation. We therefore decided to treat as many patients as were available, and our series consists of unselected cases. The dosage adopted was 1 grain for each year of age, with a maximum of 5 grains. The drug was first given in the form of pyramidon crystals, but in the simultaneous treatment of a large number of patients, an aqueous solution containing 1 grain to the drachm was found to be more convenient and less likely to give rise to nausea. Owing to its somewhat bitter taste, a few of our early patients who received the drug in powder form experienced slight nausea, but the liquid form was well tolerated and no idiosyncrasy or any harmful effect was noted in any of the cases. The appropriate dose was administered four hourly day and night until the temperature had settled. The treatment is comparatively cheap, the cost amounting to only a few pence per patient.

Results of Treatment

The results of the treatment were very encouraging but the type of measles prevalent in London during the winter 1929–30 was milder than usual and we are therefore chary of making claims which further investigation might show to be inapplicable to a more severe type of the disease. The best results were achieved in the earlier cases, but even in the later stages the treatment appeared to benefit a certain number of patients. Our experience agreed with that of Hovne in the respect that the tendency to broncho-pneumonia was lessened and complications were fewer. Some patients who were already suffering from broncho-pneumonia on admission to hospital did well, but the drug did not seem to exert any influence on measles laryngitis or measles enteritis. In view of these observations we could not substantiate the claim that the drug exercises a specific" action. In one instance measles croup' developed in a patient whose treatment was initiated in the prodromal stage, and though this case made very satisfactory progress the occurrence of a serious early complication was unlooked for, despite a subsequent good result. From a reference by Hovne to the 'customary salicylates' one would gather that treatment by drugs presumably administered for their antipyretic effect, is the usual practice in the treatment of measles in America. The efficacy of amidopyrin as an antipyretic is well recognized and for this reason it is not surprising to find that Hovne regards it as an advance on previous medicaments. Our own experience amply confirms this antipyretic effect, which was exhibited in almost every case.

In the majority of instances the temperature dropped to normal within twenty-four hours of the administration of the drug, and though the precise therapeutic effect of a mere lowering of temperature may be a debatable point, a decided improvement in the patient's general condition accompanied the decline of the pyrexia. In a number of cases in which complications had supervened before treatment was initiated pyrexia continued though on a lower level. Some writers have claimed that the use of amidopyrin in the prodromal stage will frequently exercise an abortive effect on the disease, and in one of our cases this effect certainly followed the giving of the drug, but we are well aware of the fact that a similar result in an untreated case would be by no means a phenomenal happening.

Our case was that of a boy who was admitted to hospital with pyrexia, coryza and the usual appearance of a measles patient in the prodromal stage. Numerous Koplik's spots were visible, but he had no exanthem. Treatment was commenced on the afternoon of the day of admission, and next morning the boy was perfectly well. A few macules were then seen on the trunk, but no further symptoms appeared, and the rudimentary eruption only lasted for a few hours, during which time the patient appeared to be in excellent health. On the other hand, the case has already been referred to in which "measles croup" occurred in the prodromal stage of an attack for which treatment had already been commenced. The typical eruption appeared in this case, and was followed by quite marked staining. In many instances where the treatment was begun during the eruptive stage the duration of the rash appeared to be shortened, but in other cases the eruption followed its usual course even though there was considerable amelioration of the general condition. The treatment cannot therefore be said to have any constant effect on the measles exanthem. Two tables are appended in which we have briefly summarized our results, our criteria for the allocation of cases to the different categories being severity of disease, duration of pyrexia and other symptoms, presence or absence of complications, and length of stay in hospital. The omission of statistics referring solely to complications will be noted, but we are of opinion that, as a number of our cases were of a comparatively benign type the inclusion of these figures without the records of a parallel series of untreated cases would be unduly flattering to the treatment. In a subsequent communication, dealing with our experience of an extended series of cases, we hope to be able to furnish these and other details.

TABLE I.—*Results according to Age Groups*

Age in Years	No. of Cases Treated	Good Result A.*	Good Result B†	No Apparent Benefit	Died
1 (and under)	34	15	6	10	3
2	27	12	8	6	1
3	29	11	15	4	0
4	34	14	18	2	0
5	16	9	6	1	0
6 to 9	10	5	3	2	0
Totals	150	65	56	25	4

* Cases in which the good result was apparently attributable to amidopyrin.
† Case in which a good result followed treatment but in which such factors as age, mildness of disease, etc., may have largely contributed to the favourable progress.

TABLE II.—*Results according to Stage when Treatment was Initiated*

Stage	No. of Cases	Good Result. A	Good Result B	No Apparent Benefit	Died.
Prodromal	3	2	0	0	1
First day rash ...	46	27	13	4	2
Second ,, ...	63	26	23	8	1
Third ...	20	7	8	5	0
Fourth day and later	18	3	7	8	0
Totals	150	65	56	5	4

The case of measles croup already referred to is not included. The result was good but symptoms of measles first developed during convalescence from scarlet fever which may have influenced the course of treatment.

Comment

The four deaths were due to broncho-pneumonia and in each of the cases a coexisting enteritis was a contributory factor. Three of the cases were admitted on the same day

from an institution in South-East London These patients were in an early stage of measles, but enteritis was already present in all three instances It is interesting to note that another case, previously admitted from the same institution, was also found to be suffering from enteritis, though no definite evidence of measles could be found in this patient It is therefore possible that in this small group the enteritis was a precursor and not a complication of measles

As might be expected, the best results were obtained in the earlier stages of the disease In the later stages a few cases showed some very encouraging results, so that the treatment is not devoid of value even after some days have elapsed before the case comes under observation Infants and very young subjects furnished the largest number of cases which derived no apparent benefit from treatment, and we have had under consideration the question of the advisability of increasing the dosage in these cases

Conclusions

1 Amidopyrin is a valuable adjuvant in the treatment of measles

2 Its action is chiefly antipyretic, but it appears to exercise some influence on the other symptoms of the disease

3 Its value is greatest when given in the earlier stages, and in some instances it appears to modify the attack, but even in the later stages its use may be followed by good results

4 From the results in our series of cases we are not yet in a position to give a definite pronouncement on the claim, made by certain writers, that the drug is a "specific" for measles

5 The treatment is comparatively inexpensive, and very simple in its method of administration In the dosage used by us it seems to be devoid of deleterious effects

6 The use of amidopyrin merits further investigation over an extended series of cases

AMIDOPYRIN IN THE TREATMENT OF MEASLES

BY

W H W ATTLEE, M D, M R C P,

MEMBER OF THE ETON COLLEGE MEDICAL BOARD

THE favourable reports in the *British Medical Journal* on the use of amidopyrin in measles decided me that it must be tried in an epidemic which happened to be going on at the time It was a good opportunity for a test, seeing that all the patients were of one type and were nursed in similar circumstances The epidemic, too, was half over, and the comparison between treated and untreated cases was made easy This seems important, seeing that the severity of different epidemics varies within wide limits

The patients were all boys at school, from 12½ to 16½ years of age Each was nursed in a separate room with nurses who kept regular charts The disease was of a mild type, and the weather was warm and sunny Partly on this account probably, and partly because the general health was good, with an almost complete absence of catarrhal affections in the community, complications were few and convalescence was rapid In all, 120 patients were treated on ordinary lines, and nine were given amidopyrin (pyramidon)

Cases Treated on Ordinary Lines

The course of the disease in these 120 cases was similar in all during the prodromal stage None felt particularly ill and almost all wanted to eat light solids The respiratory symptoms were slight in comparison with most epidemics There was remarkably little cough and hoarseness The temperature rose to its height as the eruption appeared and then fell abruptly to normal, the whole period of real discomfort lasting as a rule, only twenty-four hours Most patients were able to get up in a week, and to go away for sick leave in a fortnight after the rash appeared In only four cases were there any definite signs of bronchial catarrh Many had transient redness of the tympanic membrane, often without any pain or other symptoms referred to the ear Two had definite otitis media needing myringotomy on both sides Both were healed within ten days

In this group the severity of the disease varied within wide limits One boy, for example, reported sick early because of the rash on his face He never felt ill The rash was scanty, the temperature was 100·4° F when he reported sick and was normal next day At the opposite extreme was a boy who felt quite ill and reported sick four days before the rash appeared Koplik's spots were present on the first day, three days before the rash The rash and the injection of the palate were intense and signs of broncho-pneumonia appeared two days after the eruption was at its height Both tympanic membranes became congested, but resolved without myringotomy The temperature was 104° at its highest, and it did not come to normal for thirteen days The average total duration of the fever was 4·07 days, and the average greatest height was 103·5°

Cases Treated with Amidopyrin

These nine patients each received 5 grains every four hours, beginning during the prodromal stage in three cases and at the beginning of the eruption in six cases The course of the disease was altogether different The rash appeared more slowly, taking thirty-six to forty-eight hours to reach its height The temperature rose as high as usual, but fell gradually and not abruptly, and the period of real discomfort was lengthened This discomfort was increased in most cases by frequent vomiting Complications were not prevented, for two patients had extensive bronchial catarrh and one of these had double otitis in addition, necessitating myringotomy on one side Two had stomatitis and laryngitis so severe as to make feeding a trial and phonation impossible, complications unseen in the group treated on ordinary lines The average total duration of the fever was 6·9 days, and the average greatest height was 103·5°

There could be no doubt that these nine cases were more uncomfortable and did less well than the others, and the fact was so obvious to both doctors and nurses that it seemed unjustifiable to continue the administration of amidopyrin

Summary

During a school epidemic of measles, nine patients were treated with amidopyrin and 120 on ordinary lines

The patients treated with amidopyrin were more uncomfortable than the others, their rashes took longer to mature, their fever was more prolonged, and the percentage of complications was higher

TREATMENT OF VARICOSE ULCERS*

BY

A DICKSON WRIGHT, M S, F R C S,

ASSISTANT DIRECTOR, SURGICAL UNIT, ST MARY'S HOSPITAL LONDON

BY way of introduction I would stress some general considerations before proceeding to the details of treatment and the results to be expected These are the prevalence of varicose ulcer, apathy of the medical profession with regard to it, the economic aspect, intractability of the disease, and its etiology

The prevalence of varicose ulcer is not fully appreciated because a very large number of sufferers seldom see a doctor The reason for this is that both patient and doctor grow tired of ineffectual treatment and avoid each other The patient either uses well-advertised remedies or is dealt with by the out-patient or district nurse The cases will come out of hiding in large numbers if they are encouraged, as witness of this, I have treated and cured upwards of three hundred cases of indolent leg ulcer during the last two years

* A paper read at a meeting of the Section of Surgery at the Annual Meeting of the British Medical Association, Winnipeg 1929

is disease falls between the two stools of surgery and
matology, and remains there by the mutual consent
he two specialties This lack of interest I prefer to
rd as due to a feeling, on the part of surgeons, that
disease is not curable except in the early cases Even
advent of the injection treatment has not altered
igs very much

omen are the chief sufferers, and in their case it
ard to assess in terms of hard cash the cost of an
r to the individual One can only imagine the
erings of the mother of a family compelled to carry
in spite of endless pain and sleepless nights Truly,
as been said, not only she, but the whole household,
ers from varicose ulcer But when we come to the
le it is not a difficult matter to take a piece of paper
l write down, item by item, the cost of an ulcer through-
its duration Most astonishing figures will result
ave one case of an ulcer which cost over £5 000 in loss
wages, pension, treatment, insurance benefit, hospital
arges, etc This patient had spent seven years of his
e in hospital at one time and another This is an
ceptional case, of course, but ulcers of a cost of £1,000
e by no means rare

Many have come to regard permanent cure in long-
anding ulcers as impossible of achievement, no more
quent proof of this could be found than the multiplicity
remedies that have been devised for its cure In an
our and a half I discovered one hundred remedies in
ie Surgeon General's Index, they ranged from playing
stream of hot air or other gas on the ulcer to dusting
with castor sugar Cestan struck an amusing note
hen he said that the only cure was a private income
f £400 a year, and unlimited rest

An almost forgotten British genius, Thomas Baynton,
urgeon of Bristol, at the time of the French Revolution
rote as follows "This disease is due to the unfavourable
ituation of the parts which are placed at a remote
istance from the fountains of life and heat, and are
bliged to return the venous blood and lymph to the heart
nder peculiarly unfavourable and disadvantageous circum-
tances" A simple experiment proves his contention A
needle, connected to a glass tube eight feet long, is inserted
nto any varicose vein, the blood rises instantly to the
evel of the clavicles The patient holds his breath the
blood rises to the level of the ears If he now lifts a
heavy weight in both hands, the upper level rises far above
his head, and the venous pressure is even greater than
the arterial All the sixteen complications of varicose veins
are the direct result of this venous pressure There is no
need to invoke a stubborn bacterial infection to account for
the chronicity of varicose ulcer, it is purely a matter of
hydraulics It is sometimes said that the large indurated
ulcer is not due to varicose veins, the veins are certainly
there, nevertheless, but lie deep in callous oedema

Rationale of the Treatment

Put the hydraulics right and the ulcer will take care
of itself, this is the gist of the method The oedema is
harmful and the varicose circulation useless so they
should be squeezed out of existence by an adequate and
uniform compression

Then comes the question of dressing the ulcer It
seems the rankest heresy to recommend that the dis-
charge of an ulcer should not be allowed to escape, but in
practice it is found that almost all ulcers, if hermetically
sealed with sticking plaster, will heal better than when
treated with any antiseptic or stimulating dressing known
Baynton first discovered this 150 years ago, but his
method has been almost forgotten as have possibly
other good things in the wave of antisepsis following the
discoveries of Pasteur and Lister Maybe the antivirus
of Besredka, or the bacteriophage of d Herelle, is thus
allowed to fulfil its curative mission unhindered by well-
intentioned but injurious interference

TECHNIQUE OF THE TREATMENT

1 *First Attendance*.—The highest visible varicose veins
are injected with 5 per cent sodium morrhuate, then, no
matter how fetid and dirty the ulcer may be the leg is
firmly encased from foot to knee in a 3-inch spiral
bandage of elastoplast adhesive The zinc oxide and
rubber adhesive is spread upon a domett base in this
type of bandage, it is comfortable, lies smoothly on the
leg, and is very rapidly applied To prevent any tendency
for the bandage to creep," two 2-inch longitudinal
splints of the same material are laid on the sides of the
leg above the ankle, and the spiral is applied over these
The patient is then instructed to walk home She will
notice while doing so that the bandage, most un-
comfortably tight at first, soon adjusts itself to the leg,
and she experiences comfort which has been unknown to
her for years A very gratifying feature is the improve-
ment in sleeping which results The patient is also
instructed to work, to seek for work, or to take exercise
Discharge will seep through the bandage, and should be
washed off with soap and cold water It is explained to
the patient that a free discharge is beneficial

2 *Interval between Attendances*.—The period before
returning varies according to (1) the amount of oedema,
(2) the size of the ulcer, and (3) the position of the ulcer
(1) Where the oedema is great the bandage becomes loose
rapidly, it may have to be renewed within three days to
keep pace with the expulsion of oedema (2) When the
ulcer is very large, the profuse discharge will at first
necessitate renewal twice weekly of the bandage Healing
is so rapid that the intervals can soon be increased
(3) When the ulcer lies over the malleoli the movements
of the ankle loosen the bandage, and more frequent
renewals are required in these cases The interval between
the first two attendances, and also between the successive
visits, varies from two days to two months, according to
these three factors, the usual time being two weeks

3 *Second Attendance*.—When the second attendance
is made the patient removes the bandage This is
painless, because alopecia precedes ulceration in cases of
varicose veins, and because the discharge has lifted the
bandage from the surface of the ulcer, thus no damage is
done to new epithelium or granulations and there is no
bleeding At the routine inspection more varicose veins
will be seen or felt, because of the reduction in the oedema,
and these are injected If the ulcer is large skin grafting
is performed In order to keep the treatment ambulatory,
the grafts are buried under the granulations as small
inserts or darned in the form of skin threads, or injected
in the form of mince The ulcer is then covered with
adhesive in exactly the same manner as before, and the
grafts "take" with monotonous regularity The grafts
are always autogenous, and are removed from the arm as
a rule, the wound caused by their removal being carefully
sutured On this occasion, as on all others, the ulcer is
measured by means of a squared celluloid transparency,
and the area is plotted on a chart This stimulates both
the surgeon and the patient The healing changes in the
ulcer are noticed within a week, the raised edges are
flattened out, the healthiest of granulations appear, and
the leg rapidly resumes its original size and symmetry

4 *Subsequent Supervision*.—When healing is complete
the support is continued in a modified form by means of
one of the ready impregnated Unna's bandages many of
which are on the market now This support is kept up
for three months, and then the patient is given the
following instructions (1) to report every three months
so that any fresh veins may be injected, (2) if possible,
to wear boots instead of shoes, (3) to cover any small
abrasions of the leg with adhesive, and (4) if the ulcer
is due to 'white leg" an elastic support, such as the
"Bourgeaurd," should be worn continuously

Two illustrative cases will show the effects of treatment

CASE I.

A woman aged 64 had been a sufferer from varicose veins for
forty years and from ulcer for twelve years In spite of assiduous
hospital attendance during those twelve years the ulcer had
steadily increased to the size of 21 square inches The leg was
elephantoid the ulcer lying more than half an inch below skin
level. Under compression treatment there was complete relief
from pain and insomnia weight was gained and the haemoglobin
figure improved by 30 per cent Seven weeks from the first
attendance the ulcer was firmly healed and the volume of the
leg became 7 pints as compared with the original 10½ Varicose
veins invisible at first soon came to the surface and were dealt

with by morrhuate injections During the whole period of treatment the patient had complete freedom from the pain which for twelve years had made her life a misery

CASE II

A man aged 52, developed typhoid fever complicated by femoral thrombosis thirty years ago in the Boer war An ulcer appeared as soon as he got about Since then this never healed, but slowly grew to encircle the leg and measure 31 square inches in area His total hospitalization over the thirty years amounted to seven and a half years Every treatment, including skin grafting, was tried, amputation had been repeatedly refused, and the pensions committee had awarded him a lifelong pension of £2 per week A most conservative estimate of the cost of this ulcer to the patient and State gave a figure of over £5,000! With twenty-one weeks of the treatment outlined previously he was completely cured During the whole period of treatment he followed the most unfavourable of occupations, that of a house painter, earning £4 to £5 per week He stated that during the treatment he had less pain than at any time in the course of the disease There were no varicose veins at all in this case, so the patient is now wearing an elastic support to prevent recurrence

These two illustrative cases, by no means the most severe, are taken from a series of 324 cured patients (478 ulcers) with a total area of 1,480 square inches, or rather more than 10 square feet of ulcer surface The average rate of healing was 1 square inch in 5·1 days In two years I have only treated three patients who did not continue treatment, and only one who did not respond to it—a woman who died shortly after from an abdominal malignancy Of these 324 patients no fewer than 33 had refused amputation at some time or other, it is thus seen that we can, with this method, retrieve some of these derelicts from what Mayo has described as the "surgical dust heap"

CHRONIC ULCER OF THE LEG TREATED BY THE METHOD OF DICKSON WRIGHT

BY

J H TWISTON DAVIES, M B,

HONORARY DERMATOLOGIST TO THE ROYAL SUSSEX COUNTY HOSPITAL,

AND

A E DRYNAN, M B,

HONORARY CLINICAL ASSISTANT IN THE DERMATOLOGICAL DEPARTMENT, ROYAL SUSSEX COUNTY HOSPITAL

WE have thought it worth while to publish our first results in the treatment of chronic ulcer of the leg by this method The number of ulcers having an area of more than five square centimetres bears a small proportion to the total number of ulcers treated In nearly every case, however, the healing of the ulcer was a relatively minor episode in the restoration of comfortable function to the affected limb We have only recently devised an apparatus for measuring the reduction in size of the swollen and brawny legs on which ulcers and chronic dermatitis occur, and so we are not in a position to produce numerical evidence of the improvement we have been able to obtain in what formed the bulk of our material As regards the restoration of painless function, we can only say that our patients have been unanimous in their appreciation of what this treatment has done for them the comfortable theory which we used to hold in view of our failure to relieve—that such patients preferred to enjoy their disability—has been almost completely abandoned There seems to be little doubt that the results previously obtained in out patient work have always been inferior to those obtained by the individual doctor Whenever we have discussed this method with our colleagues in general practice we have generally found the latter fairly well satisfied with their own results, and unwilling to regard our present results as worth the very little extra trouble that they involve

It is of course probable that with rest in bed many of these ulcers would have healed but as already stated, by the Dickson Wright technique an important further advance is made in that the leg is reduced to near size, cured of its tendency to swell, and in many we believe, secured from the possibility of further Moreover, with this method the patients are able a indeed encouraged, to go about their work dur whole of the treatment Pain disappears dur first forty-eight hours, with treatment by rest in bed is generally aggravated Healing of the ulcer can cally be guaranteed, and the duration of treatme this part only of the cure, can accurately be calcula the formula

$$\frac{\text{Area of ulcer in square centimetres}}{5} + 3 = \text{time in w}$$

As regards the cost of the treatment, one cas quoted

Attendance at out patient department, including roll of lint, 4 oz ointment 1/2 lb wool, and two open wove bandages every week for six years	£5 10
In patient treatment—five months at £2 per week	£10 0 0
	£15 10 0

This contrasts with treatment by us

Twelve special adhesive bandages at 2s 3d	£1 7 6

We understand that under the "panel" the pro of these special bandages is refused on account of exp

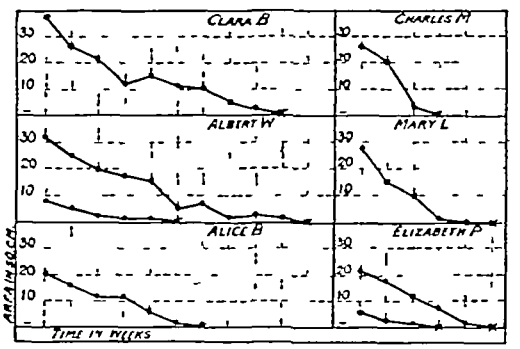
We do not describe our technique in detail, because have found that in cases where this procedure ha attempted on the strength of a bare description—pa imperfectly understood—the results have been poor have had many visitors, however, and so far as we learn, results quite as good as ours have been obta subsequently by those who have actually seen the m demonstrated practically Briefly, however, the princi are as follows

Any morbid condition which occurs exclusively or lower extremity is produced wholly or partly by stagn in the venous circulation, and the exchange of t fluids, due to the dependent position of the limb, an the varicosity of the superficial veins We take thi view on account of the remarkable results we have with diseases other than chronic ulcer—namely, e lichen planus verrucosus Bazin's disease, and ec dermatitis in every clinical variety The object, theref is twofold In the first place the limb is emptied of oedema fluid, the dilated tissue spaces being kept until they shrink to their normal capacity Secondly centripetal flow of venous blood is restored, at first by action of the muscles on the deep veins, and later blocking the varicose superficial veins Our procedure roughly as follows

The ulcer is measured by means of a piece of celluloid (a old x-ray film) ruled into squares, and the figure recorded chart The girth of the limb may be taken with a tape m or its volume may be measured by the displacement of wat a tank we have had constructed for the purpo

If any varicose superficial veins are accessible they are in at once with 5 per cent sodium morrhuate beginning a highest point The bandage is then wound on the leg star at the metatarso-phalangeal joints and ending just below knee This bandage, which is a proprietary article manufa in England is made of an elastic fabric, and is coated wit adhesive material similar to that on ordinary strapping three yards long and three inches wide The tension is va according to the amount of oedema present and in extreme may be great enough to endanger the continuity of the ba It has been found convenient to wind it from without inwa that is, in the reverse direction to the normal It is then over with talc powder to prevent it adhering to the stock the patient is instructed to walk home It is replaced in a time The patient is also instructed to do as much walki could possibly be done if the leg were healthy

No fear need be entertained as to the danger of poisoning the septic secretions of the foulest ulcer has invariably been found, on removing the bandage a week, that such an ulcer is no longer foul In a become a clean bright carpet of healthy granula surrounded by the pale-bluish margin of advancing thelium *There is no real danger of putting the l*



n too tightly Disaster only occurs from this cause if the atient takes it *on himself to* cut the bandage instead of oming to have it reapplied As a matter of fact it is hen the bandage is not applied tightly enough that any omplaint is heard in such cases the pain is not relieved, nd the leg is apt to itch

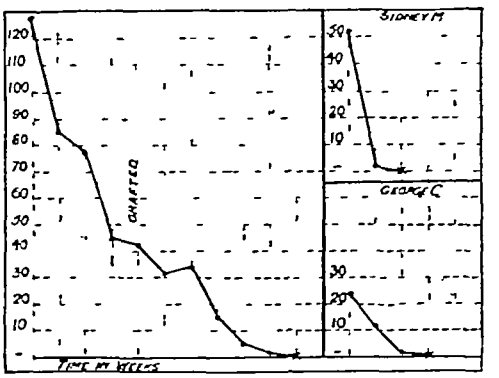
As already stated, the healing of the ulcer is a foregone onclusion, compression treatment however should be ontinued until the leg is reduced to its natural size If 'steps" are cut in the leg they give no pain, and they are a clear indication for maintaining the previous tension While this is going on the remaining varicose veins are treated as they are revealed by the disappearance of the oedema

Eventually the leg regains its pristine form the bandage then need only be applied firmly enough to maintain it until the time has elapsed for the shrinkage of the dilated tissue spaces

Clinical Histories

Clara B aged 59 first attended the County Hospital in March 1929 with chronic ulcer of the leg which she had had for eigh

or nine years The varicose veins were treated during 1929 by the surgeon in charge of the out patient department and on April 29th 1930 the ulcers being rather worse than they were before the commencement of this treatment he advised amputation The patient demurred and was referred to us and on May 2nd I found ulcerations over the internal malleolus of 23 sq cm and over the external malleolus of 14 sq cm they were both at least 2½ cm deep The girth of the ankle at the level of the ulcers was 13 inches and at the highest level of discoloration of the skin 16 inches After one week's treatment the girth at the level of the ulcers had been reduced to 11¼ inches and the combined extent of the ulcers reduced to 26 sq cm The ulcers were soundly healed at the end of nine weeks and through all this time the patient has been able to get about her business in comfort



Mary L aged 42, had had ulcers on both legs for ten years There were a number of deep linear ulcers resembling the fissures in the bark of a tree and the total area was calculated as 27 sq cm This unfortunate woman had suffered severe pain from the condition but was more concerned with the limitation of her activities which it entailed At the end of five weeks both legs were soundly healed and it may be said that the patient experienced a complete freedom from the disadvantages of her condition within three days of the treatment having been instituted

Elizabeth P had an ulcer of the leg of twenty years standing When first seen on March 4th 1930 there was an ulcer on the left leg of 22 sq cm and on the right leg another of 8 sq cm the latter was cured in four weeks and the former in six weeks At that date the legs were still swollen and hard but four weeks subsequent treatment has nearly reduced them to normal size and consistency

Mrs C attended the out patient department at the Sussex County Hospital for the first time six years ago with an ulcer on the right leg Six months later she was admitted to hospital and was kept in bed for five months On discharge the ulcer was still incompletely healed and rapidly resumed its previous dimensions in spite of treatment in the out patient department Treatment has continued uninterruptedly there ever since When first seen the ulcer measured 128 sq cm At the end of the fourth week nine small pieces of skin—taken from the anterior surface of the thigh—were embedded in the floor of the ulcer Six of these grafts took and in three weeks time were represented by areas of growing epithelium 1 cm in diameter At the end of ten weeks the ulcer was soundly healed and the patient was allowed to go away for her holiday with a bandage on the affected leg Although this was nearly three months ago the patient has not been seen again and in view of her record of constant attendance we feel entitled to assume that the ulcer has remained healed (See chart below)

Alice B aged 54 had an ulcer of many years duration which was treated by injections of the varicose veins alone during 1929 In January 1930 the patient was advised that the only way of healing the ulcer was complete rest in bed This advice was taken and the ulcer partly healed but while the patient was still in bed it broke down again and became larger than ever On May 13th she had an ulcer of 20 sq cm This was soundly healed at the end of six weeks treatment

Sidney M had an ulcer of twelve years duration he was treated from October 1928 to January 1929 by injections of the varicose veins with quinine urethane and ordinary dressings The ulcer healed but broke down again early in August 1930 On August 19th the ulcer measured 53 sq cm It was soundly healed in two weeks.

Albert W aged 55 was the least favourable of the present series of cases He is a zinc worker who has been out of work for twelve months on account of ulcerations of the legs Last year his varicose veins were treated but the ulceration became worse there was an ulcer on the left leg of 33 sq cm and on the right leg of 8 sq cm (There was no oedema of the legs) The former was reduced to 7 sq cm in five weeks but at the end of nine weeks is still incompletely healed The latter was practically healed after five weeks but neither ulcer can be said to be soundly healed at the present moment although the patient has been able to return to his work and is of course very substantially benefited by the treatment

Charles M came under observation on May 15th with the history of an ulcer just above the right internal malleolus which had been present for ten years He suffered severe discomfort and loss of rest at night with shooting pains This ulcer was 27 sq cm in area and was soundly healed in three weeks time It is worthy of note that whereas before treatment was commenced the girth of the limb above the malleoli was 11 inches and at the highest level of discoloration 14½ inches at the time of the healing of the ulcer these measurements were reduced to 9 inches and 12½ inches

George C had an ulcer of twelve months duration When seen on August 1st 1930 the ulcer measured 25 sq cm It had soundly healed in three weeks

STATISTICAL SUMMARY OF THE TREATMENT

Of 54 cases treated in the way indicated cure resulted in 31, the mean duration of treatment being 11.8 weeks One patient (Albert W) was much improved and there remain 22 cases still under treatment, the mean duration of which is 10.4 weeks

In 10 cases of eczema etc without ulcer the mean duration of treatment was 17.5 weeks in 23 cases of ulcers less than 5 sq cm it was 3.5 weeks for healing ulcer only in 16 cases between 5 and 50 sq cm it was 6 weeks and in 5 cases where the ulcer was larger than 50 sq cm it was 10 weeks an average of 8 sq cm a week The total area of ulcers healed was 970 sq cm and the rate of healing of all ulcers larger than 5 sq cm. was 5.65 sq cm a week The percentage of ulceration not responding to treatmen was 0.63

The total cost of bandages used was £78 the equivalent of a charge of £2 10s for each patient cured The cost of healing the ulcer alone for each patient was £1 15s

TREATMENT OF VARICOSE ULCERS

BY

P M DEVILLE, M R C S, L R C P,

LATE MEDICAL OFFICER TO OUT PATIENTS ROYAL WATERLOO HOSPITAL FOR CHILDREN AND WOMEN

VARICOSE ulcer is the commonest, and one of the most important complications of varicosity of the veins Of all the cases of varicose veins or of their sequelæ presenting themselves at the Royal Waterloo Hospital it occurs in about 22 per cent, but this figure is much higher than the true incidence of ulceration, as a large number of patients do not seek treatment until ulceration occurs It seems commonest in the working classes, and for this reason ambulatory treatment—if suitable to the particular case—is to be preferred to all others

In the treatment of the condition it is useful to distinguish five types these will be dealt with in order below

Ulcers with Visible Varicose Veins Unaccompanied by Deep Thrombosis

Local treatment to the ulcerated area will generally result in healing of a temporary nature, as unless the actual cause is dealt with there will always be a tendency for the area to break down again, or for fresh ulceration to ensue elsewhere in the leg In order to obtain a permanent cure the varicose veins, which impede the return of blood and lead to congestion, impaired nutrition, and ulceration, should be sclerosed It is not proposed to discuss the several solutions which may be used for the purpose, but at the Royal Waterloo Hospital the routine is to inject 5 c.cm of a solution of lithium salicylate 30 per cent, with tutocaine 1 per cent, into the largest veins and a similar amount of solution of sodium chloride 20 per cent, with tutocaine 1 per cent, into the small veins, at weekly intervals, until sclerosis is complete In the very large veins the double injection of 2 c.cm of quinine and urethane solution and of the lithium salicylate as above, each injection being given at points about two inches apart, gives satisfactory results Before any injection is given, we should ascertain that no contraindications exist, such as recent phlebitis, deep thrombosis, etc.

The ulcer itself is, in the large majority of cases, secondarily infected, and should first be carefully cleaned It is important that injections—especially those close to the ulcer—should only be commenced once the ulcerated area is as free from sepsis as possible Dressings of hydrogen peroxide, in an equal amount of water, or of cusol, are applied twice daily, and this usually suffices to give the affected area a healthy appearance in a few days Pasta zinci co (Lassar's paste) is then applied twice a day to the ulcer itself and to the congested, discoloured surrounding skin, and the whole covered with a thin sheet of gauze Scarlet red 1 per cent may be added to the paste, on account of its stimulating properties A crepe bandage should be worn at first until healing is advanced it should be applied before the patient rises in the morning, and should extend from the roots of the toes to below the knee After a few weeks the ulcer should be completely healed, and it only remains for the complete sclerosis of the veins to achieve a permanent cure

Where the ulcers are large very indurated or recalcitrant to treatment advocated above, we inject the veins with sclerosing solution at fortnightly intervals, and immediately after the injection apply elastoplast bandages firmly and evenly from the toes to the knees The bandages are applied directly to the skin and ulcers, and no other dressings are advised The elastoplast bandages in many respects are better than Unna's paste bandages

Ulcer with no Visible Varicose Veins and with no Deep Thrombosis

In these cases the ulcer tends to be larger than in the previous group The leg is usually hard, œdematous, and discoloured No veins are visible, but one here and there may be made out by palpation and these should be injected if possible, observing the cautions above

The treatment consists in supporting the tissues and aiding the return of blood by the application of suitable bandages Either an Unna's leg bandage or an elastoplast may be used The ulcer is first cleaned with hydrogen peroxide, then dried, and any palpable vein injected If it is decided to use Unna's paste then the margins of the ulcers and the surrounding skin for about three inches are painted with Unna's paste, using an ordinary flat brush, the ulcerated area itself not being touched An ordinary crinoline bandage 3 or 4 inches wide and 6 yards long, rolled up from each end, so that the two rolled ends meet at the middle of the bandage, is soaked in hot water for a few minutes, and then squeezed as dry as possible With the patient's leg raised and supported by an assistant, the bandage is applied firmly from the toes to the knees one roll being in each hand The whole surface of the bandage is then covered with one or two coats of Unna's paste, and allowed to dry an ordinary bandage may then be rolled round the leg to prevent the stocking from coming into contact with the paste This Unna's leg bandage should be left on a week or ten days, and then renewed until healing is complete

The composition of the Unna's paste used is zinci oxide 9 parts, glycerin 20 parts, gelatin 9 parts, water 20 parts

The elastoplast bandage may be used instead of Unna's leg bandage These bandages are applied with the patient lying down on a couch, the affected leg being raised as high as possible by an assistant Beginning the first turn round the roots of the toes, the bandage should extend to just below the knee, it must be applied evenly and tightly, and must directly cover the ulcer, which has previously been cleaned Badly applied, it causes uneven pressure and discomfort to the wearer Any discharge from the ulcer will soak through the bandage, and can be cleaned off with some boric lotion The elastoplast is left on five or seven days at first, according to the amount of discharge coming through, and in the later stages it may be only renewed every fortnight As the œdema subsides, veins not previously palpable may be found and injected This is the method of choice, as healing is rapid, application easy, and no preparation needed as the bandage is bought ready for use The following are typical cases

Mrs H B, 53 years Varicose ulcers for nine years Treatment with elastoplast began on May 15th Seven weeks later the ulcers were completely healed

Mrs A S, 48 years Large ulcer encircling half the leg Treatment with elastoplast began on August 11th When last seen, in September, the ulcer was practically healed

Ulcers with Deep Thrombosis of the Veins

In these cases injection is contraindicated, as the superficial veins are the only channels of return for the blood usually carried by the deep veins Sclerosis of the veins would therefore only aggravate the existing condition and lead to disastrous consequences If, in a patient with varicose veins, a rubber tourniquet is applied round the thigh and the muscles made to contract by walking, a suction is exerted on the superficial venous circulation by the deep veins and consequently the superficial veins collapse In deep thrombosis this, however, cannot take place, and the superficial veins do not collapse, but become more distended (Delbet and Mocquet's sign) Treatment consists in aiding the circulation by rest, with the limb raised whenever possible and the application of a supporting bandage, such as the Unna's leg bandage or elastoplast bandage already described All standing is avoided, and in severe cases rest in the recumbent position, with the affected leg raised, is necessary Healing is generally slow Quinine and urethane 3 to 6 minims may be injected into the base of the ulcer in two or three places, at weekly or fortnightly intervals Once healing is obtained, the scar is dusted with pulv zinci amyli and a crepe bandage worn Care should be taken to avoid all trauma to the limb, as the scar is very apt to break down again In cases with recent superficial phlebitis the same treatment is required, but after an interval of six months injections into the veins may be begun, proceeding cautiously with small doses and longer intervals between each injection

Ulcer with Periostitis of Tibia

In all cases where the ulcer is large and lies over the tibia an x ray examination should be made for periostitis Deep thrombosis may or may not be present These ulcers are as a rule more painful and more resistant to treatment Rest, the injection of quinine or urethane into the base of the ulcer, the sclerosis of the veins and the application of an elastoplast are the main lines of treatment, and give good results where deep thrombosis is not present Scarification of the edge scrapping of the floor of the ulcer, Leriche's sympathectomy, and skin grafts have been recommended Ultra violet light from a mercury arc lamp on alternate days, directly to the ulcer does not seem to be of great value Finally in severe and extensive cases with deep thrombosis when all other treatment has failed, amputation should be performed

Multiple Ulcers

In a case of varicose veins with multiple ulcers the Wassermann reaction should be investigated, and, indeed the ideal to aim at is the carrying out of this test in every case presenting ulcers on the leg It is well to bear in mind that although the typical varicose and syphilitic ulcer have fairly well defined characteristics, there occur cases which clinically seem to belong to the varicose group yet are resistant to the treatment for the latter have a positive Wassermann reaction and clear up remarkably quickly when antisyphilitic treatment is instituted

I desire to express my thanks to Mr Lodney Maingot F R C S for permission to publish this article

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL

DIFFERENTIAL DIAGNOSIS OF ENCEPHALITIS EPIDEMICA IN NIGERIA

In view of the observations of Pfister on the prevalence of encephalitis epidemica in China (*British Medical Journal* June 29th 1929 p 1156), the following notes may be of interest

A powerfully built Fagan man aged about 32 presented himself for treatment on July 20th 1929 complaining of shaking of the limb for nine years He had an upright carriage and stood like a statue with the knees slightly flexed His face was expressionless but the eyes looked intelligent The speech was slurring and almost unintelligible while the lips remained motionless He had difficulty with mastication and deglutition and traces of food soiled the chin and chest His intelligence was above the average as was evident during the subsequent examination All his movements were slow and deliberate The elbow joints were slightly flexed the right more than the left and the hands were held in front of him The upper limbs showed small involuntary myoclonic movements at the elbow joints the left greater than the right These movements were absent during rest but when he was agitated they were augmented and involved both knee-joint also The hands were in the interosseal position but there was no involuntary movement of the finger The history began nine years ago with headache fever and shaking of the limbs together with transient diplopia and lethargy the shaking of the limbs continued up to the time of examination

Tests of the facial muscles showed a slight but definite and slow ptosis There was a faint tremor of the tongue which was protruded a little to the right The eyesight appeared normal and both pupils reacted to light The fundus and media were healthy in both eyes the eye movements were normal and there was no nystagmus There was no swaying The knee jerks were brisk the test for Romberg's sign was negative and co-ordination of the limbs was unimpaired The carriage was upright but the gait was slow with short careful steps There was always some degree of flexion of the knee joints and the feet were lifted well clear of the ground No area of anæsthetic to pin pricks were discovered The lungs and heart were normal and the blood pressure was 128 83 which is customary for a hill Fagan There was no albumin in the urine and micturition and defæcation were normal The temperature on admission was 96.8° F and the pulse rate 60

A fresh blood film showed a very slight degree of auto-agglutination of the red blood corpuscles The serum formalin reaction was negative after twenty four hours The cerebro-spinal fluid was under normal pressure and an average of three counts with the Fuch Rosenthal counting chamber gave three white cells per cubic millimetre The acetic anhydride reaction of the cerebro-spinal fluid was negative

Differential Diagnosis—The following points are against a diagnosis of trypanosomiasis, which is prevalent in many parts of Nigeria (1) *The patient's home was in country* free from the tsetse fly, and he had never travelled out of his district, owing to head hunting traditions (2) The absence of palpable cervical and other glands (3) The length of history, high degree of intelligence normal white cell count in the cerebro-spinal fluid, and the serum formalin reaction negative after twenty four hours, are all unusual in an advanced case of sleeping sickness (4) In the only three cases of advanced trypanosomiasis in which the acetic anhydride test was applied by me to the cerebro spinal fluid the reaction was positive I have also found that auto agglutination of the red cells in trypanosomiasis is usually marked (5) True somnolence has not been observed

The white count and negative acetic anhydride reaction in the cerebro-spinal fluid are against cerebral syphilis In this connexion Melkers on (*Acta Medica Scandinavica*, 1926) found that this reaction gave 100 per cent positive results in general paralysis of the insane, and the great majority positive in other syphilitic lesions of the central nervous system

Against paralysis agitans are the age at onset, the absence of pill rolling movements of the fingers, the upright carriage, and the slow, careful gait

CARCINOMA OF THE LARGE INTESTINE IN EARLY LIFE

Carcinoma of the large intestine fairly common between 20 and 30 years of age not infrequently occurs in much younger patients Ewing[1] refers to records of cases at 12 years (cæcum) 12 years (sigmoid) 11 to 17 years (rectum) and 3 year of age (colon) Pfuhler (1923) *collected twenty three cases of carcinoma of the sigmoid* or rectum in children under 16 years and Wainwright (1927) seven cases above the sigmoid In the practice of an individual however and even of a hospital the disease at such an early age is sufficiently rare to be noteworthy

The case recorded here, that of a girl aged 15 years was seen on August 25th, 1930 with acute intestinal obstruction the culmination of a chronic obstruction of about three months' duration and of unknown origin Exploration undertaken immediately showed the cause to be a hard, ring like infiltration of the descending colon The tumour was not adherent, and there were no signs of secondary deposit In spite of a cæcostomy the patient died eight days later

A post mortem examination was made by Dr C D Dawson, pathologist to the hospital, who reported as follows

Below the splenic flexure the canal is much narrowed by a greyish raised ulcerated firm annular growth gelatinous looking on section Microscopically the muscular wall is honeycombed with spaces containing epithelial cells in an advanced state of mucous degeneration Deeper in newly formed scar tissue is a diffuse carcinomatous infiltration

No evidence of metastasis was found Apart from the statement that the maternal grandfather died of a cancer of the kidney there were no points of interest in either the previous medical or the family history

I have to thank Dr C D Dawson for the pathological details and the medical superintendent Dr J D Ewart for permission to record the case

Reports of Societies.

SURGERY IN DIABETES

AT a meeting of the Section of Surgery of the Royal Society of Medicine on December 3rd, with MR C H FAGGE in the chair, PROFESSOR G E GASK opened a discussion on surgery in diabetes

Professor Gask said that in pre-insulin days diabetes had presented a difficult problem to the surgeon TREVES in 1898 had stated that diabetes offered a serious bar to any kind of operation, and that the wounds refused to heal readily, providing a suitable soil for the development of putrefaction and the growth of pyogenic bacteria The discovery of insulin had altered the position profoundly, and Banting's work had influenced the surgery of the whole world In the case of a patient for whom an operation of convenience was proposed, such as the cure of a hernia, the presence of diabetes offered no bar to an operation, and but slight addition to its risk Where a patient required surgical intervention to save his life, the discovery of diabetes should not lead to the postponement of operation, a suitable dose of insulin should be injected before the operation, and afterwards he should receive a course of antidiabetic treatment In cases of gangrene occurring in diabetic patients, opinions differed about the course to be followed In pre-insulin days amputation was performed as early and as high as possible, gangrene of the toes, for example, was treated by amputation at the knee-joint, where the collateral circulation was good Nowadays more conservative treatment could be employed, and in some cases the spread of local gangrene could be prevented Where pyogenic infections, such as carbuncle, were associated with diabetes insulin should be given as soon as possible, and all steps to lessen the infection should be taken early, since sepsis tended to aggravate the diabetes The anæsthetic of choice in operative procedures was a local one, and recent improvements in local anæsthesia made this method possible in the majority of cases If local anæsthesia were contraindicated, general anæsthesia with gas and oxygen or, if necessary, ether should be used, but chloroform was the least desirable of all anæsthetics in diabetes

DR GEORGE GRAHAM, who followed, also made some reference to the limitation of surgical practice in diabetes before the discovery of insulin, but was able to quote the history of two patients described by MR SPENCER in 1892, both of whom had gangrene of one limb, one refused operation and died in diabetic coma, and the other recovered after amputation When sugar was discovered in the urine of a patient the diagnosis of diabetes could only be established by a sugar tolerance test If there was time, the patient should be prepared for operation by means of dieting and insulin for from four to seven days He considered that every hospital should have a dietitian and a diet kitchen, so that there should be no chance of errors in feeding following transference to a surgical ward On the day of operation 50 grams of sugar and 25 to 50 units of insulin should be given three hours before the patient went to the theatre, in order to ensure that there should be plenty of glycogen in the liver In cases of acute abdominal crises occurring in diabetic patients, there was no time for such preparation, the blood sugar should be estimated if possible, but if this was out of the question 50 grams of dextrose and anything from 25 to 75 units of insulin should be administered early Where vomiting was severe, glucose in saline solution should be injected intravenously, this had the additional advantage of restoring the salt content of the blood After-treatment required that the same food should be given as an ordinary patient would receive, insulin being increased as necessary Urine should be passed and tested every three hours, if possible, and the sugar content be taken as an indication of the insulin requirement Correlation with tests of the blood sugar content had shown the urine to be a very fair guide Gangrene in diabetes only occurred in conjunction with arterio-sclerosis In cases of acute pyogenic infection the longer the patient remained without insulin the worse the diabetes became DR GRAHAM described two cases in which the insertion of radium into neoplasms had produced a similar exacerbation This, however, had passed off with the removal of the radium in the first case, the second patient was still under treatment In a patient with fracture of the neck of the femur, moreover, a great increase in insulin had been required Provided that the insulin was increased sufficiently to balance the damage done, there was little danger that the sugar tolerance would be impaired on recovery from such acute conditions The speaker believed that many elderly patients without true diabetes benefited by insulin given during pyogenic infections and before operation

DR R D LAWRENCE said that in cases where the surgical condition was not dependent on coexistent diabetes, as in appendicitis, operations could be performed with the same degree of safety and success as in non-diabetic cases, the responsibility for controlling the diabetes during and after operation falling upon the physician Among 163 diabetic patients on whom he had operated for cataract, carbuncle, gangrene necessitating amputation, and for other conditions not dependent on diabetes, only thirteen (8 per cent.) had died Of these only one had died in diabetic coma, the remainder succumbing to complications such as pneumonia, embolus, heart failure, uræmia, or septicæmia The chief dangers of operation on diabetic patients were shock and severe post-operative acidosis DR LAWRENCE usually gave 100 grams of carbohydrate before operation with a balancing dose of insulin, afterwards modifying the insulin according to the results of urine and blood sugar tests The variability in the needs of different cases was extreme Chloroform was the worst anæsthetic to use, because of its toxic action on the liver Infiltration should not be employed where local sepsis was present, since it might lead to extensive sloughing A spinal anæsthetic was ideal whenever possible, and the speaker said he had had good results with avertin The anæsthetic should be chosen with a view to minimizing post-operative vomiting, from which a patient might drift into acidosis DR LAWRENCE described two cases of diabetic patients in whom serious abdominal operations had been tolerated well as a result of insulin and glucose given during the post-operative period in quantities determined by the height of the blood sugar He agreed that gangrene occurred only when arterio-sclerosis was present, in the foot if pulsation was good in the dorsalis pedis artery, a favourable result often followed without operation In dry gangrene there was no occasion to intervene hurriedly, only in rapid, spreading gangrene with much œdema was high amputation urgently necessary In intermediate cases he advised drainage of sepsis, treatment of the diabetes, and no immediate intervention, many such lesions would heal Finally, the speaker drew attention to the condition known as "diabetic acute abdomen" This occurred in patients with severe ketosis who were in the pre-comatose state there was vomiting, pain, tenderness, and vague abdominal rigidity If the temperature was raised it was in favour of a non-diabetic origin of the illness, but it was almost impossible to make a definite diagnosis, leucocytosis offered no indication, since it commonly exceeded 20,000 in severe ketosis Insulin and enemata might cause a disappearance of symptoms, but in cases of doubt it was wiser to operate and find nothing rather than to delay treatment of a perforated appendix

MR CARL NITCH recalled the fact that glycosuria might occur as a result of apprehension Following operation on a diabetic patient the nurse should be warned of the danger of hypoglycæmia The urine should be tested by Benedict's method four-hourly, and insulin should be given according to the degree of reduction observed Fluids were important in hypoglycæmia, since the patient became dehydrated by deep respiration, and the acidosis was increased Mild cases of gangrene should be treated conservatively with local applications, warmth, and ultra violet light if the dorsalis pedis artery was patent Severe pain was an indication for operation, but it should be remembered that the sudden removal of a large area of sepsis sometimes produced hypoglycæmia

DR O LYTON disagreed that patency of the dorsalis pedis artery should decide the need for, or level of, amputa-

tion and described a case where he had unwillingly performed Syme's operation on both feet of a diabetic patient, the dorsalis pedis being occluded on both occasions, perfect healing had followed He mentioned the recent experiments of Harandranath Muckerjee, who had found it possible to produce hypoglycaemia with phosphotungstate of insulin given by mouth, and whose results he had been able to confirm at the London Hospital In surgical cases where injections were resented by the patient, this might offer a good method of controlling diabetes Whether it was harmful when given over a long period had not yet been discovered

Dr P J CAMBIDGE advised the use, not only of glucose and insulin before operation but of glucose and saline solution given intravenously before the patient was taken back to the ward He found that this tended to prevent post-operative vomiting During the first three days after operation 80 to 100 grams of glucose, with insulin to *balance it, should be given daily Control should be based* on the blood sugar readings throughout and these could be obtained conveniently by a colorimetric method

Mr J B HUNTER advised conservative measures and treatment of the diabetes when acute cellulitis arose usually a localized abscess formed which could be drained He thought indolent gangrene of the toes should be treated with the patient sitting in a chair, but not recumbent since the pendent position reduced the danger of spread of infection up the tendon sheaths Patients were much more cheerful following operation if kept on a full diet and large doses of insulin than if their diabetes was controlled by dieting alone

Dr ERIC SKIPPER said that elderly diabetic patients should be advised to keep their feet scrupulously clean and dry and to avoid unskilled operations on their own corns Dr GRAHAM, in his reply, endorsed this, and Professor GASK summarized the opinions of the meeting All were agreed that the patient should have surgical treatment when necessary, without regard to his diabetes, in the treatment of gangrene opinion leaned to conservation, and it was accepted that if surgical intervention was required the patient should have careful pre- and post-operative treatment controlled by an expert

TREATMENT OF FRACTURES OF THE UPPER EXTREMITY

AT a meeting of the Section of Orthopaedics of the Royal Society of Medicine on December 2nd, with Mr P JENNER VERRALL in the chair, Dr LORENZ BÖHLER of Vienna lectured on the treatment of fractures of the upper extremity, illustrating his remarks by several reels of cinematograph film showing actual manipulations on patients

Dr Bohler began by describing the treatment of fracture of the middle and proximal end of the humerus The arm was anaesthetized by the injection of 20 c cm of 2 per cent solution of novocain at a point between the fracture ends He demonstrated how the fracture was reduced and how the splints were adjusted, bent to the required shape and fastened with calico bandages The splints he used were padded with cellulose or cotton, and the apparatus was made quite immovable the patient could *be kept eight or ten* weeks if neces ary with the same splint After two weeks in such an injury as he had described the patient could move the fingers, hand and elbow and the muscles of the shoulder were also active, in ten weeks as shown again by the cinematograph illustration all movements were completely free and active Dr Bohler next demonstrated the treatment on similar lines of a fracture of the distal third of the humerus During supination of the forearm the lower fragment was always in an inverted position, but this was immediately corrected by pronating the forearm With the elbow flexed to a right angle and the forearm radiated inwards an unpadded plaster splint was put on, and the fracture was reduced under strong tension To prevent the shoulder from stiffening, and to ensure good circulation in the whole arm, the arm was flexed on a double right-angle splint Here again all joints were completely active after ten weeks, and the muscles quite strong The lecturer also showed the operation of reduction and treatment of fracture of the clavicle with marked displacement Again this was performed under local anaesthesia with novocain and the fracture was reduced by abduction of the shoulder girdle from the chest A clavicular splint was applied and all movements were completely free and active four weeks after injury In fracture of the neck of the scapula the best treatment was always the use of an "aeroplane" splint The difficulty was to retain the fragments in position until there was good union He demonstrated the form of wooden splint which he used, two straps being applied to the chest and one strap to the opposite shoulder this held the arm away apart from the chest Usually fractures of the lower end of the humerus were fixed and reduced in supination of the forearm, but sometimes in pronation, depending upon the character of the fracture *and the need for reducing pressure on the nerve*

Turning to the reduction and treatment of severe forearm fracture, Dr Bohler described his method of securing complete local anaesthesia and illustrated the operation of reduction by strong longitudinal traction Rustless wire was introduced through both bones near the wrist and through the olecranon process, preventing the displacement of the fragments To prevent circulatory disturbance the arm was placed on a double right-angle splint, and after a week the fingers and shoulder could be actively moved He gave a detailed account of the apparatus of extension, emphasizing the need for strong and slow pulling so as to procure good relaxation of the muscles The wires remained in the bones for from six to ten weeks He had now treated a large number of fractures of the forearm in this manner, and he believed it to be the best The trouble in much unsatisfactory treatment of forearm fractures with complete lateral displacement was that insufficient time was allowed to effect bony union, which would never be obtained in less than eight weeks With regard to the reduction and treatment for fracture of the radius with marked displacement and splintering, he showed how counter-extension was produced by means of a strap The local anaesthesia continued for about two hours if the reduction was not complete at the end of that time another injection could be given Dr Böhler remembered one case in which reduction was only completed after six hours the patient having to be given three injections On the film he showed the manipulations of hyperflexion and forceful traction of the forearm and the application of a splint One interesting little point was that in all the cases the patient's history was clearly marked in indelible pencil on the plaster cast, together with a sketch of the injury and plan of treatment

Finally, the lecturer demonstrated his method of reduction and treatment of a fractured finger, using local anaesthesia with novocain A wire splint was fixed to the wrist by means of a plaster and the finger was attached to the wire splint in hyperextension by means of adhesive tape A fracture was reduced by gradual bending of the wire splint Eight weeks later the patient had a useful hand Dr Böhler showed similarly his method of dealing with fractures of the wrist In order to get a bony union in the scaphoid, the shortest time for fixation was six weeks here again unsatisfactory results were generally due to too short a time being allowed *The procedure in various* fractures of the metacarpal bones was illustrated and the results were shown graphically by the free movements of the hands in the cinematograph

Mr B E SCHLESINGER said he was particularly interested in the question of infected compound fractures Dr Böhler seemed to have been fortunate in that his compound fracture cases came to him for treatment very early, enabling him to practise primary closure of the wounds Every surgeon knew how unsatisfactory was the general problem of dealing with heavily infected wounds A method of dealing with such wounds when it was too late to perform a primary suture was suggested to him in Gallipoli during the war He found that in a bad compound fracture the wound became heavily infected with maggots, but the more heavy the maggot infection the

better were the end-results It appeared that the natural method whereby heavily infected wounds were cleaned was through the agency of the fly, the wounds became full of maggots, and the maggots ate the dead tissue Therefore in Gallipoli he had undertaken the breeding of maggots and had implanted them into the wound, covering the wound over with wire netting The maggots, when implanted, resembled little pieces of cotton, they transformed the wound from a septic sloughing mass into a bright red granulating area, covered with a curious sort of evil-smelling slime, which was otherwise harmless Later the maggots were gently scraped away, leaving a perfectly clean granulating wound, on which a secondary suture could be done quite well The method certainly had its value, and the patient could generally be persuaded to overlook its aesthetic disadvantage

Mr REGINALD BROOMHEAD described a visit he had paid to Dr Bohler's clinic in Vienna He found there excellent team work, and the patients appeared to be progressing most satisfactorily under simple treatment In Leeds he had been treating compound fractures on the lines laid down by the lecturer, and the cases had done extremely well He had used dressings of vaseline gauze, and he thought the granulation tissue found on their removal was healthier than that in Dr Bohler's cases One striking feature about Dr Bohler's work was that no massage was practised in his clinic, and the speaker believed he was right in that omission The habit of "pump-handling and waggling things about" did more harm than good

Mr HOSFORD commented on the entire absence of general anaesthesia, and also on the neglect of massage Sometimes with the local anaesthetic there was not complete anaesthesia, because the novocain did not apparently make its way between the bones, but in cases where absolute anaesthesia was obtainable he thought the local anaesthetic very useful In fractures of the lower end of the radius an unpadded plaster cast was very valuable, and the patient could use his hand immediately In those cases where a splint did not fit absolutely, the plaster had a great advantage, because it fitted the patient closely, he could move his hand, elbow, and shoulder, and so avoid subsequent stiffness If the patients were able to move their shoulders from the very beginning they did not suffer from any stiffness, and an instruction to raise their arms two or three times a day to the full height above the head was advantageous He had not recently used massage in fractures of the lower end of the radius In cases in which he was not quite certain as to the result he had removed the dorsal plaster splint and applied a new plaster cast (the old plaster cast never fitted a second time), after ten days or a fortnight more it could be finally taken away Mr MCCRAE AITKEN said that one of the noteworthy things about Dr Bohler's teaching was the necessity for patience and continuity in treatment True principles never changed, though each man had his own technique The technique of local anaesthesia in such cases was fairly new to him, and the lecturer's results were amazing and interesting

Dr BOHLER, in reply, stressed the need of rest for all wounds, not only for fractures He gave an account of his experience in the treatment of compound fractures during the war He also replied to a question on his treatment of cases of separated epiphyses in a child Reduction was not possible by extension alone, but by a combination of bending and pulling it was effected In his technique for local anaesthesia he sometimes injected not from one point, but from two or three

SPLENOMEGALY

AT the last meeting of the Section of Pathology of the Royal Academy of Medicine in Ireland, the president, Dr J LAIT, read an address on some aspects of splenomegaly

Dr Lait first discussed the haematological diagnosis of splenic enlargements He said that types readily recognized by a complete blood examination included leukaemia, Addison's anaemia, leukanaemia, von Jaksch's anaemia, erythraemia, acholuric jaundice, and the rare condition of Niemann's disease Dr Lait then described certain reticulo-endothelial diseases in which the splenomegaly often dominated the clinical picture Abnormal metabolism, or storage of lipoid by the reticulo-endothelial system, resulted in the clinical entities of Gaucher's disease and Niemann's disease As supporting evidence he referred to experimental hypercholesterolaemia, and to the cases reported by Schultze and Dyke He postulated congenital dysfunction of the reticulo-endothelial blood forming and blood-destroying tissues as the etiological factors in acholuric jaundice and erythraemia respectively The parasites of kala-azar were so often found exclusively in the cells of the reticulo-endothelial system that this infection could be called a disease of the reticulo-endothelium Tracy's conception of Hodgkin's disease as a reticulo-endotheliosis was an advance, although the cause still remained obscure, its result was defined Finally, Dr Lait discussed the evolution of the infective hypothesis of the idiopathic splenomegalies, and referred to splenic anaemia and Banti's disease He demonstrated spleen specimens showing the Gandy-Gamna nodules in which the possibly specific organism had been found, and showed photomicrographs of sections from spleens in which mycelium like threads were clearly visible He had also identified Gandy Gamna nodules in a syphilitic spleen, and in one form a case of myelogenous leukaemia

Dr T G MOORHEAD criticized the president's statement that Banti's disease was never hereditary, in view of the fact that the case reported by the president was that of a boy whose father had suffered from the disease Too little was yet known to justify dogmatism about either the incidence or the etiology of many diseases in which the spleen was enlarged At one time acholuric jaundice was looked upon as a purely familial disease, and then later on it was recognized that non-familial cases were met with In the same way Banti's disease was generally regarded as non familial, but Dr Moorhead believed that a familial variety would be recognized before long He had recently seen a patient suffering from lymphatic leukaemia with some splenic enlargement An interesting and unusual feature about the blood was that the red corpuscles agglutinated almost instantaneously, so that it was impossible to make blood films for examination Dr E T FREEMAN reported that he had seen two such cases of rapid agglutination, one was a case of malignant disease, and the other of septicaemia in which transfusion had been impossible owing to the rapid agglutination preventing testing the blood Dr R H MICKS had also encountered two cases in which agglutination had taken place rapidly, one being a case of pernicious anaemia

OCULAR CHANGES DUE TO FOCAL SEPSIS

AT a meeting of the Medical Society of London on December 8th, with Dr R A YOUNG in the chair, the subject for discussion was pathological conditions of the eye due to inflammatory changes in other parts of the body

Mr A F MACCALLAN, in introducing the subject, said that a few years ago the suggestion that focal sepsis could account for any form of eye disease was treated generally with contempt by ophthalmic surgeons, but opinions had changed since then The earliest reference to the subject in English literature which he had been able to discover was in a book by Sir William Lawrence, published in 1833, on diseases of the eye, in which the effect of a carious tooth in causing eye changes was mentioned, but there were references in Continental literature as far back as the end of the eighteenth century Mr MacCallan indicated a number of ocular conditions which seemed to bear a definite relation to focal sepsis In the first category he included conditions which might frequently be cured by the elimination of the focus of sepsis without any other treatment One of these was increased lacrymation, which was frequently encountered without deformity of the eyelids Another was one form of chronic conjunctivitis, also some forms of ulceration of the cornea, while iritis in one of its manifestations was entirely dependent on the absorption of toxins from some septic focus in the mouth, tonsils, or

prostate In the second category he included conditions which might be alleviated by elimination of the focus of sepsis These included one form of keratitis, progressive myopia which could usually be traced to some form of local or general sepsis and thrombosis of the retinal vessels His third category was conditions which were, in his experience, invariably associated with some form of focal sepsis, but in which no improvement was effected by elimination of the focus Among these were cataract, by which he meant any opacity in the lens or its capsule which could be detected after the pupil had been dilated, glaucoma of which he had not seen a case for five years in which severe focal sepsis was not demonstrable, and some cases of detachment of the retina due to inflammatory exudation between the retina and the choroid The commonest sites of focal sepsis which might react on the eye were the mouth the tonsils the accessory nasal sinuses, the intestinal canal, the gall-bladder, the prostatic urethra, and the pelvic organs in the female Even an ingrowing toenail had been reported by a competent observer to have been responsible for ocular changes The chief forms of oral sepsis associated with eye conditions were pyorrhoea, apical abscess septic stumps, buried fragments of previously extracted teeth—it was estimated that fragments were left behind in 30 per cent of all cases of extraction—unerupted and impacted teeth and also residual sepsis The exciting agent might be living or dead bacteria, or toxic or disintegration products In the great majority of cases the toxic products were the exciting agents Apart from the more serious forms of eye disease, such as iritis and detachment of the retina, there was among the more numerous class of patients who came up for glasses a proportion showing some slight ocular changes which did not necessarily prevent the attainment of full normal vision with the aid of glasses These conditions included various opacities of the lens and of the vitreous, the latter being sometimes realized subjectively by the patient as floating spots In these cases also a possible septic focus should be sought

Mr ERNEST CLARKE said that it was generally acknowledged now that many pathological processes in the eye which were formerly labelled idiopathic or "gouty," on the ground that the cause was undetermined, were associated with inflammatory conditions in other parts of the body which had set free toxins in the blood Iritis and corneal ulcers from a septic tooth or tonsil were perhaps the commonest examples These conditions of the eye were visible and the patient probably went at once to an ophthalmic surgeon as it was recognized that the eye was attacked, but there were a large number of pathological states of the eye which, if the vision was not impaired, were never seen by the oculist, certainly in the early stage, but which the physician should discover, for the processes going on in the eye, which could be seen, were identical with the same processes occurring in other organs, which could not be seen For example, the catarrhal nephritis of pregnancy might be associated with acute retinitis, haemorrhages and exudates being seen all over the fundus oculi The eye condition in these cases was not caused by the condition of the kidneys, but both owed their origin to a toxin, whatever it was in the blood If the macular region escaped there might be very little interference with vision The physician who made a practice of using the ophthalmoscope as often as the stethoscope might discover the eye trouble in its early stage, the stage which the oculist seldom, if ever, saw This meant that in the case just illustrated he would discover the kidney trouble before it manifested itself The physician might find a few small haemorrhages in the retina which at once made him look for some focal sepsis He might also be able to "spot" the very beginning of arterio-sclerosis The speaker had seen many cases of so-called albuminuric retinitis in which, had they been seen earlier the patient's life might have been prolonged or saved There were many structures of the eye that allowing for certain variations were similar to those of other organs and affected in the same way The living eye was Nature's laboratory and the one part of the body where changes could be closely watched Mr Clarke mentioned certain cases of retinal haemorrhage due to focal sepsis which were cured by discovering the cause When there were toxins in the blood these produced dilatation of the small retinal vessels but if the septic cause were discovered and removed the haemorrhages would disappear, and, if the case was seen early, no trace or scar would be left In advanced cases it was sometimes difficult to tell whether a retinitis was associated with renal disease or was the result of arterio-sclerosis It was very often only a question of degree As a rule, renal cases were bilateral, there was a star shaped figure around the macula Life was rarely prolonged in these cases beyond two years, and death occurred from uraemia In cases in which there was arterio-sclerosis only about half were bilateral, life was more prolonged, and death occurred from cerebral haemorrhage or heart disease Haemorrhages in the deeper layers of the retina might sometimes be fairly large, and though they might be absorbed yet, if the cause was not removed, they recurred, and, by pressure on the delicate surrounding parts, did irreparable harm Hence the extreme importance of early diagnosis and no one using the ophthalmoscope as a routine part of the examination was likely to miss them

Dr MORELAND MCCREA mentioned a case of detached retina which had recently been sent to him in which there was an extremely bad antrum otherwise in the general examination there was nothing reported An operation was done on the antrum and three days later, so far as one could make out in the nursing home, there was full vision He took it that behind the detachment there must have been some exudate The patient was extremely optimistic about his eye condition, but his optimism was not shared by the speaker, because the man had extremely septic tonsils, and, in fact, his vision gradually went back to 6/36 One eye condition in which, if one happened to discover the septic focus the condition cleared up every time was iridocyclitis In cataract it was all very well to say that one should find focal sepsis but the question was at what time it was safe to operate in cataract after the focal sepsis had been removed In his opinion six months was a good minimum time for a cataract to be operated on after there had been gross sepsis in the teeth He also quoted two cases to show that old age need be no deterrent to doing operations—tonsil enucleation, etc—in people who were going blind

Mr E D DAVIS said that his experience in iridocyclitis was that about one case in ten had a septic focus discoverable On the other hand, one saw a large number of cases of severe tonsillar sepsis and severe sinus suppuration without any changes in the eye Further, he had enucleated tonsils for iridocyclitis, and had been rather disappointed to find that the condition was not improved Therefore he was not very enthusiastic at present about the discovery and elimination of septic foci as necessarily leading to improvement of the eye condition

Sir WILLIAM WILLCOX said that it was extremely interesting to hear that so many of these early manifestations of eye trouble had been demonstrated to be associated with focal sepsis There were ophthalmic surgeons who had not yet recognized the great importance which focal sepsis had upon eye conditions One condition not mentioned was thrombosis of the central artery of the retina, he had met with quite a number of cases in which this was directly due to focal sepsis Another very important eye condition which was recognized as due to focal sepsis was retrobulbar neuritis He mentioned the importance of removing dead teeth, however normal they might appear on x ray examination They were always a potential source of danger As to the time for operating on the eye condition after a dental extraction or tonsillar operation, he thought that it took about three weeks for the body to regain its immunity

Mr HERBERT TILLEY showed a few anatomical drawings to illustrate the close proximity of the nasal sinuses to the eye He particularly pointed out the honeycomb of the ethmoidal cells just on the inner border of the eyeball, and indicated the path of infection With regard to age in operation his own view was that there was no limit of age beyond which septic foci should not be removed He described a successful operation for removal

of the tonsils in a woman aged 72, who insisted on the operation being done, and was very much better after it

MR HAMBLIN THOMAS asked whether there was any danger of making the eye condition worse by intervention for removal of the septic foci, seeing that the system might be flooded with toxins He had heard it said by ophthalmologists that squint and defective vision were due very often to weakness of the muscles Was that muscular weakness due to the direct action of the toxins, or to the general endocrine or other condition?

MR WILLIAMSON-NOBLE said that a good many of them had had the experience that iridocyclitis seemed to go on in spite of the removal of various kinds of focal sepsis He had found in certain cases a course of tuberculin beneficial He thought one had to be careful not to get an exaggerated idea of focal sepsis in some of these cases He also mentioned one instance in which persistent eye trouble did not clear up until an infection of the colon was discovered and treated by a series of Plombieres douches

The president (DR YOUNG) said that within the last few days he had seen an interesting example of residual infection and its relation to ocular conditions It was the case of an edentulous woman suffering from chronic rheumatoid changes, with regard to whom they were told that there was very marked residual infection in the jaws as seen by *x* rays Bacteriological examinations were carried out with somewhat negative results, as previously vaccine treatment had been extensively used In order to try to get further vaccines a bacteriologist punctured the cancellous tissue of the maxilla and obtained a useful culture of *Streptococcus haemolyticus* Within a very short time there was an acute "flare-up" in the joints, and also some uritis He agreed with Mr Williamson-Noble about the valuable effects of tuberculin in some ocular conditions He had seen a number of cases greatly benefited by its cautious use, and in one or two of them he had found bovine tuberculin of more use than the human form

MR MACCALLAN and MR CLARKE briefly replied to questions

AT a meeting of the Section of History of Medicine of the Royal Society of Medicine on December 3rd with SIR HUMPHRY ROLLESTON, president, in the chair, a discussion was held on the relation of the teaching of the history of medicine to clinical teaching In an address entitled "Clio by the bedside," DR W R BETT opened the discussion by a strong appeal for the teaching of the history of medicine as an integral part of the student's medical course as tending to broaden his outlook He urged that a knowledge of the history and previous methods of treatment of various diseases tended to give the clinician a better appreciation of the extent to which he should follow or differ from his predecessors In the discussion that followed, many members of the Section took part, and also members of the Section of Medicine Among the speakers were SIR HUMPHRY ROLLESTON, SIR STCLAIR THOMSON, DRS PARKES WEBER, G C PEACHEY, R O MOON, A CAWADIAS, J D ROLLESTON, W LANGDON BROWN, H S STANNUS, F R FRASER, J A LINDSAY, and KINGSTON BARTON The general opinion emerged that, while a knowledge of the history of medicine was both useful and desirable, the present overcrowded state of the student's curriculum forbade its inclusion as a separate subject, but that it would be an advantage if every lecture or demonstration could be preceded by a brief historical sketch appertaining to the subject in hand

---

THE next award of the Hunterian Society's medal will be made in 1932 The object of the medal is to encourage individual efforts among general practitioners in advancing the science and art of medicine The competition is open to all general practitioners resident within Great Britain, Ireland, and the Channel Islands, whether Fellows of the Society or not The medal will be awarded for the best essay on some subject, chosen by each candidate within the province of medicine surgery, and midwifery All essays must be received on or before December 31st, 1931 The rules governing the award may be obtained on application to the honorary secretaries DR D C NORRIS, 14, City Road, E C 2, and MR Andrew McAllister, 79, Wimpole Street, W 1

Reviews.

THE ROLL OF THE I M S

SEVENTEEN years ago Colonel D G CRAWFORD published a full and authoritative *History of the Indian Medical Service*, tracing its development from the barber surgeons attached to some of the earliest commercial settlements of the East India Company down to the time of the outbreak of the great war This he has now supplemented by the work before us—the *Roll of the Indian Medical Service, 1615–1930*[1]—a handsome quarto of over 760 pages, which aims at giving the name of every man appointed to the service up to the present year, with particulars of his date of birth, his medical school, his qualifications, the dates of his successive commissions, war services, honours literary work, etc In appropriate cases the dates of retirement and death are added The record is not confined to those who served in India proper, for special lists enumerate the surgeons employed in the Eastern Settlements, St Helena, China, Prince of Wales Island and the West Coast of Sumatra In addition, a dozen appendixes provide subsidiary information of interest, such as a list of members killed in action and statistical analyses of honours conferred, degrees, medical schools, etc, while a preliminary chapter is devoted to correcting and bringing up to date the *History* already mentioned The index, in small type and double columns, fill fifty five pages, and contains nearly 6,600 names

It is scarcely necessary to say that this compilation, which is the result of years of labour, is marked by the same accuracy, thoroughness, and knowledge that distinguished Colonel Crawford's previous work He has sought far and wide for information bearing upon his subject, and his acquaintance with the available sources printed or manuscript, is so complete that in some instances he has been able to correct statements in the official records Although from its nature a work of reference rather than one for continuous reading, much curious information will be found here and there in its pages Such is the story of Sir Robert MacAra given on page xxxix He served as surgeon on board various Indiamen for nearly twenty years, all the time holding a combatant commission in the British army Then he took to active service in the Black Watch distinguished himself greatly during the Peninsular war, was given the command of his regiment and made K C B, and finally was killed at Quatre Bras On page xlix some interesting information is given upon duelling, though the author has not been able to discover a case of an officer of the service being killed in a duel We may also note that, when working out the history of Gilbert Pasley of the Madras Medical Service (p 256), Colonel Crawford discovered to his surprise "that he was my own great-great-grand-uncle" Such are the rewards of authorship!

The table on page 649, showing (as far as information is available) where the different members of the service were born, will interest many readers From it we learn that while in the period 1804–36 the Scotsmen far outnumbered the Englishmen, during 1885–96 the proportion was reversed, though in the grand total the former were not far behind the latter The contribution of Ireland was less than one-half of that of Scotland Several European countries figure in the list while Persia, Syria, and Palestine provided one member each The analysis on page 651 of the occupations of the parents of members ranging from artisan to peer, affords no less curious reading, as also the analysis (p 638) of degrees and diplomas

The rapid Indianization of the service has aroused many misgivings, particularly among the general body of European residents in India, and our author appears to share these dismal forebodings That his volume is gowned in melancholy black cannot be regarded as possessing any special significance, but the motto ("Ichabod") which he had placed upon his title-page leaves little doubt as to his views, which are perhaps natural enough in one who has

[1] *Roll of the Indian Medical Service 1615–1930* Compiled by Lieut.-Colonel D C Crawford Bengal Medical Service (retired) London W Thacker and Co. 1930 (7½ × 10 pp 11 + 711. 28s)

dwelt so long upon the glories of the past The change, however, was inevitable and we can only hope that the effects will be less detrimental than has been feared Already the Indian members have taken an honourable place in the list (p 629) of officers killed in action, of the intellectual attainments and manipulative dexterity of many of their number there can be no question and, while there must doubtless be some difference in outlook the new recruits are not likely to prove in any sense to the traditions of the great service to which they have the honour to belong Certainly there can be no better method of stimulating the desired *esprit de corps* than is afforded by Colonel Crawford's self-sacrificing labours

PATHOGENESIS OF CANCER

In a monograph *On the Nature and Pathogeny of Cancers and the Radical Cure of Spontaneous Malignant Growths in White Mice*,[2] Dr E GEORGIOU discusses what he believes to be the relation of the pineal gland and ovaries to the development of malignant tumours, and describes briefly a series of experiments bearing on the subject Dr Georgiou's theory is that the pineal gland induces in the cells of the body a tendency to undergo retrogressive evolution—in other words to return to the primitive form by going back through the stages they traversed in the course of progressive evolution He rejects the doctrine that in their evolution organized beings follow as it were a one way street maintaining that after reaching a predetermined goal of development they quite naturally and inevitably turn back on the same road till they reach the primitive form once more and he supposes that this process applies as well to individual tissues as it does to the organism and the race Granted this hypothesis it is easy to conceive of cancer formation as a stage in the reversed process and thence as an aspect of normal physiological development

According to Dr Georgiou the pineal gland's capacity for bringing about retrogressive evolution is potential only it becomes manifest through the agency of some external factor usually an irritant It is thus he explains the localized character of cancer formation The ovary he believes exercises a function directly antagonistic to that of the pineal gland, and because normally its influence preponderates it succeeds in keeping the tendency to retrogression in abeyance It therefore the ovarian function is deficient that of the pineal gland can come into play and an appropriate irritant would then induce a localized malignant growth Furthermore if the pineal could be eliminated by excision or otherwise the retrogressive tendency of the body cells would stop and cancer formation would not occur and this, the author maintains, is exactly what happens as proved by his experiments As an additional measure he advocates supplementing the ovarian function by means of an ovarian graft in order to restore the tissues to a normal condition or, as he expresses it to rejuvenate them

Such appears to be the author's theory though the adoption of a somewhat verbose style makes it occasionally difficult to follow The experiments on mice were conducted as follows four groups, each of twelve mice suffering from spontaneous cancers were taken from every member of the first group the pineal gland was excised of the second group every member received the same treatment, but in addition was subjected to ovarian grafting in the third group ovarian grafting was attempted without pineal excision but none of the grafts took the reason according to the author being that the pineal gland exercised a dominating influence the fourth group served as a control The outcome of these experiments was that in the first group the tumours completely disappeared but the animals showed no signs of rejuvenescence, in the second group the tumours disappeared completely from the seven animals that survived the operation and these showed signs of rejuvenescence in the third and fourth groups the tumours showed no signs of cure The author does not state whether these experiments have been confirmed by other observers

[2] *On the Nature and Pathogeny of Cancers and the Radical Cure of Spontaneous Malignant Growths in White Mice* By Dr E Georgiou London and Woking Unwin Brothers Ltd 1930 (5½ × 8 pp 47)

DISEASES OF THE THYROID

DR N B FOSTER's compact little book on *Diseases of the Thyroid Gland*[3] with a section on malignant growths of the thyroid by his colleague at the New York Hospital EUGENE POOL, appears to have been published previously in North America with a wide acceptance It begins with a summary of the anatomy and physiology and then deals with thyroiditis, goitre, tuberculosis syphilis, myxoedema, and Graves's disease The author points out that when exophthalmic goitre appears in childhood it occurs four times more often in girls than in boys Even granting an inherent constitutional condition which renders the individual peculiarly liable to Graves's disease, a further exciting agent is postulated, and the question is discussed whether this is a primary structural change in the thyroid or whether the real cause must be sought elsewhere in the body perhaps in the adrenals The child-like hand of some patients is regarded as due to this disease being complicated by the presence of status lymphaticus, and the shape of the hands has been compared to that shown in the picture of Monna Lisa In the section on malignant disease the work of I B Wilson of the Mayo Clinic is largely drawn on, and good accounts are given of carcinoma arising in an adenoma, which is responsible for the majority of the malignant neoplasms, and of carcinomas arising in aberrant thyroids in the neck, mediastinum, or base of the tongue There is a useful select bibliography

CLINICAL BIOCHEMISTRY

DR IVAN MAXWELL'S *Clinical Bio-chemistry*[4] is a book which deserves considerable popularity It was originally intended apparently, as a textbook for students, but it should certainly make a wider appeal than is implied by that statement, for the author has managed to treat in a practical manner most of the problems that comprise the routine work of a chemical pathologist In addition, however he has given a brief, but quite adequate account of the purpose of the various tests and estimations which he describes, and of their place in the investigation of the disease This feature should make the book of value to the student, who is at present rather badly served in the matter of textbooks of biochemistry For the most part, he has nothing but his practical handbook and the textbook of physiology (if he is at the pre-clinical stage) or of medicine (if he is at the hospital) and in general neither of these latter discusses the biochemical aspects of the subject in an adequate or inspiring manner It is a pity that with so much space devoted to "methods" the author should describe only one for the estimation of the blood sugar especially as that one is by no means the most generally employed. There is an obvious error in the description of the estimation of urea and non-protein nitrogen of blood since the reader is instructed to perform the former on a blood filtrate and the latter on whole blood, clearly the reverse must have been intended

MIDWIFERY FOR NURSES

MANY textbooks for nurses err on the side of over-technicality, or are marred by inaccuracy and general looseness of statement Neither of these fault can be attributed to *Practical Midwifery for Nurses*,[5] by Dr BETHEL SOLOMONS Master of the Rotunda Hospital After a brief but excellent introduction on nursing ethics and two chapters on anatomy and physiology normal pregnancy and labour and puerperium are dealt with these constitute roughly half the book A few differences from some of the English schools of teaching will be expected The chin is not used in describing face presentation but the mechanics of head descent as discussed here will be clearly appreciated by nurses who are unused to the Rotunda classification The method of saving the perineum

[3] *Diseases of the Thyroid Gland* By Nelson Barnes Foster With a Section on Malignant Growth by Eugene H Pool Mirror Monograph Series London Baillière Tindall and Cox 1930 (Cr 8vo pp viii + 174 7 figures 6s net)

[4] *Clinical Bio-chemistry* By Ivan Maxwell M D B S M S Physician and Medical Superintendent West Ham Municipal Hospitals Second edition Wm Heinemann 1930 (8½ × 5½ pp xii + 220 21 figures 15s net)

[5] *Practical Midwifery for Nurses* By Bethel Solomons M D F R C P I M R I A Oxford Medical Publications London Humphrey Oxford University Press 1930 (Demy 8vo pp xi—334 Lo figures 8s 6d net)

and the "washing up" of the patient are peculiar to the Rotunda Control of the fundus after delivery is discountenanced, as is also the practice of twisting the membranes The instructions given in the event of retention of some part of the membranes seem scarcely full enough The latter part of the book deals with abnormal pregnancy and labour and puerperium Accidental haemorrhage, placenta praevia, and the method of dealing with extended arms are particularly well described, and the question of sepsis is adequately treated, but the chapter on obstetric operations makes no reference to perineal suture There are two chapters on the infant, and the question of feeding is discussed without fad and with great clarity The statement that "the child should only have one breast at a feed " is strangely dogmatic, and some surprise will be evoked by the author's remark that he has "seen no definite ill effects from starchy food" The illustrations are good, the index adequate, the printing excellent, and the slips few and, luckily, unimportant The chapter on ante-natal care is good, and a sense of proportion is well preserved Throughout the book emergencies are well covered, and the instructions given are sufficiently precise

DR ANDERSON'S *Lessons in Midwifery*[6] is a sound and useful textbook, written, as the author says in the preface, at the request of his pupils It is a smaller work than that reviewed above, and will be used less as a book of reference than as a manual for examination purposes It is, however, by no means a "cram" book The heavy type headings are well chosen, the apportionment of space is good on the whole, and the twenty-one illustrations (including some "touch pictures") are clear

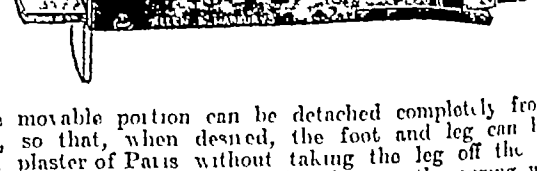
The ninth edition of Professor DE LEE'S *Obstetrics for Nurses*[7] will be welcomed not only in America The text has been reset throughout, and the excellent illustrations have been "done over," some by Felix Eisengraber of Munich The chapter on infant feeding has been rewritten by Dr Arthur F Abt and Dr B F Feingold The type is very good indeed, and the instructions to nurses are definite and detailed—perhaps too detailed for the British nurse It is now twenty-six years since the appearance of the first edition, and there has been a steady improvement both in presentation and in substance The book will be welcomed by all midwives who wish, not merely to satisfy examiners, but to read largely

The *Nurses' Handbook of Obstetrics*,[8] by LOUISE ZABRISKIE, is a new American work, well printed and illustrated, but poorly indexed It is worth reading by those who wish to know something of the details of training and practice in an American lying-in hospital

NOTES ON BOOKS

ROGERS'S *Text Book of Inorganic Pharmaceutical Chemistry*[9] is not designed to provide a general training in the foundations of chemistry for pharmacists, but is intended to give the pharmacist who has been adequately trained in elementary chemistry a closer acquaintance with the characters and properties of medicinal chemicals The point is emphasized by the author in his preface that a student of pharmacy ought not to build his knowledge of chemistry out of the facts taught him in connexion with his pharmaceutical training, but should first prepare an adequate foundation in the main principles of chemistry, and he has written the book in accordance with the presumption that it will be used to supplement books on general chemistry, and not to take their place, as is sometimes unwisely done with books on pharmaceutical chemistry The work is prepared on a methodical plan It gives for each of the substances under description an arrangement of subheadings, such as properties tests for identity commercial methods of manufacture laboratory methods of manufacture and quantitative determination The information given is useful ample and sound The only expression we have noticed in it that was left dubious by the printer is the formula of sodium salicylate We like particularly the historical notes relating to the discovery or first production of certain elements and compounds, and it is pleasing to observe educative references to many subjects which have no relation to pharmacy, but which the educated pharmacist is quite properly expected to know

The eighty seventh annual issue of the *Medical Directory*, for 1931,[10] which has just been published by Messrs Churchill, appears to maintain the exceptionally high standard of accuracy and assiduity in compilation that has distinguished its predecessors The present volume contains 55,035 names compared with 54,537 in the previous edition A decrease of 166 names is recorded in Ireland, and slight decreases have occurred in Scotland, Wales, and the Services, but these are more than balanced by substantial additions in the provinces and in the names of practitioners residing abroad The increase in London during the year was 73 Little alteration is noticeable in the general arrangement of the volume Dr R Fortescue Fox has revised his descriptive summary of the spas of Great Britain Ireland, and New Zealand, which are now classified as principal British spas, other inland health resorts, and health resorts of the British coasts This useful summary is illustrated by a number of new photographs In the body of the work care has been taken to note the administrative changes effected by the Local Government Act and a section is incorporated giving particulars of appointments to the Prison Medical Service Some idea of the task—and success—of the publishers is conveyed by the fact that the new issue has no fewer than 2,263 pages



The success of the little volume on *The Clinical Examination of the Nervous System*,[11] by Professor MONRAD KROHN of Oslo, is gauged by the fact that five editions have appeared since 1921 In the latest several additions have been made, including a short description of the methods of ventriculography and encephalography, and a description of the use of hypertonic solutions in the reduction of intracranial tension The book is well illustrated, and the orderly way in which the facts are marshalled makes it worthy of a place on the reference shelf of students of neurology and psychiatry

PREPARATIONS AND APPLIANCES

A SPLINT FOR POTT'S FRACTURE

DR J E HEPPER (Brenchley, Kent) writes The accompanying illustration shows a new splint for Pott's fracture It is a back splint, the lower end of which with attached foot piece, is capable of being moved from side to side The dislocation is reduced and the leg is put up on the splint the foot piece being fixed in a direct line with the splint by means of a nut on the under side The side pieces are then fixed to the foot piece, and the heel is secured in position by cotton wool padding The side pieces are strapped together over the ankle joint, further locking the heel The nut is then loosened, and pressure, exerted on the outer side of the movable portion by means of a spring acting along the outer side of the splint, maintains the complete reduction of the ankle-joint

The movable portion can be detached completely from the splint, so that, when desired, the foot and leg can be put up in plaster of Paris without taking the leg off the splint The splint can be used for either leg, as the spring will fit on either side The leg piece can be lengthened or shortened as desired, and the foot piece can be adjusted backwards or forwards on the movable portion Detachable side splints are fixed to the leg piece so as to anchor the leg firmly, thereby preventing twisting, and so making the pressure on the movable portion more effective The nut securing the movable portion to the leg splint is made of wood so that clear x ray photographs can be obtained, both antero posteriorly and laterally, when the foot is fixed in position

Messrs Allen and Hanburys Ltd are the makers.

BRITISH INSTITUTE OF RADIOLOGY

ANNUAL CONGRESS

THE annual congress and exhibition of the British Institute of Radiology (incorporated with the Röntgen Society) took place at the Central Hall, Westminster on December 3rd to 5th. An exhibition of radiological apparatus, material, and literature, to which more than twenty firms contributed was opened by SIR HUMPHRY ROLLESTON. The exhibition was full and interesting but it was distinguished from previous events of the kind only by certain additional refinements in apparatus, and not by any revolutionary advances.

The president of the Institute, MR C. E. S. PHILLIPS, O.B.I., one of the earliest members of the former Röntgen Society, delivered an address from the chair. It was a survey of recent events in radiology, more particularly from the point of view of one interested in the engineering and physical aspects. Of the six papers read to the congress four dealt with the mechanism of *x* ray apparatus. Of the other two, one was a demonstration of research on the growth of bone as illustrated by radiography, by DR H. A. HARRIS, and the other, a description of changes in the bones in hyperparathyroidism and hyperthyroidism by DR DONALD HUNTER. The latter was illustrated by cinematograph films. Two memorial lectures were delivered to the congress. One was the eleventh Mackenzie Davidson Memorial Lecture, which was by Professor G. P. THOMSON, F.R.S. on "Some recent experiments on cathode rays", the other was the *thirteenth Silvanus Thompson Memorial* Lecture by DR A. E. BARCLAY, which is the subject of extended mention below.

The Danger of Specialization

In his Silvanus Thompson Lecture DR A. E. Barclay took as his theme 'The danger of specialization.' He suggested that in the medical curriculum what was needed was a dictator who, with knowledge and not arbitrarily, could say to one and all, "Thus far shalt thou go and no farther." He, that unwelcome dictator would be able to say: This is useful and essential that may be useful, but is not essential, therefore you shall not teach it as part of your routine outline course." Why should the student learn masses of detail which seemed to have no practical application? Why should Providence be tempted by making everyone learn the technique of operations which only a very few would ever have the skill or the experience to perform efficiently? Each specialist was trying to teach as much as possible of his own subject to men who in nine cases out of ten, would neither have the opportunity nor the wish to practise that particular specialty. For that one man in ten the teaching was too little to be of real value for the other nine it was just so much detail to cram up for examination. Dr Barclay believed that the medical student could be just as adequately prepared for his life's work in a shorter period. It was, however, only by co-operation, placing the common good before departmental interest, that the student's burden could be reduced without impairing efficiency. Each branch needed to know more and see more of the work of other branches, so that they could co-operate effectively in a team. The danger of specialization was, of course, well recognized, and steps were taken to combat it in various ways. Team work, however, seemed to be the only practical solution, and for the radiologist team work was essential.

What is the aim and object of our education, whether it be in medicine or in science? Are we to aim at turning out a *uniform herd of specialists, a large proportion of* whom must in reality become general practitioners, or are we to direct our energies primarily towards developing the highest type of general practitioner, with sound common sense, out of which the specialist can evolve in due course? What is the student's aim? If he is taught by specialists he is likely to aim at being a specialist, and the result in this direction is already profoundly disquieting. In my experience it is very exceptional to find any of the best class of students who has the intention of undertaking the self-denying life of a general practitioner if he can possibly become a specialist. Therefore we have fewer and fewer of that wonderful type of medical man which has placed the prestige of our profession so high, and which is traditional as the family friend, the wise counsellor, whose wide and common sense knowledge of medicine gives confidence not only to his patients but to those consultants to whom he applies for help in time of need. In this country this change is a mere tendency as compared with the United States, where the man who calls himself a general practitioner is almost defunct."

Dealing with the question as it affects radiology, Dr Barclay said that although the practitioner of diagnostic radiology happened to work in a laboratory he was essentially a clinician. His department must be a clinical service department, *self-centred and self-contained only because its methods were so highly specialized that centralization* of the service was the only way to progress and efficiency. Radiology covered such a wide field and was still extending so rapidly that it was now impossible for any radiologist to be other than a general practitioner in the subject and to specialize in certain branches. Radiotherapy alone, for example, had become a subject of such proportions and dependent on such a variety of laboratory research that, unless he specialized in therapy, the radiologist could not keep up with the progress in this one very important branch.

Annual Dinner

The congress ended with a very enjoyable dinner at the Trocadero Restaurant, over which MR C. E. S. Phillips presided. In proposing the toast of "The Institute," MR Cuthbert Andrews referred to the recent formation of radiographic societies in different parts of the country—in Manchester and Birmingham and also in Scotland. These societies were independent of the Institute, but he hoped some way would be found of establishing a bond between them. MR Andrews went on to give some amusing *examples—we hope not apocryphal—of recent* "well-informed" newspaper comments on radiology. One comment stated that 'MR —— has presented the hospital with a complete set of *x* rays"! A description of the opening of the *x* ray department at a local hospital after recounting how the chest of the mayor was *x* rayed, stated that the hospital possessed "one of six sets of *x* ray apparatus in the United Kingdom." But these examples were matched by the hospital secretary who wrote to the manufacturers that he had been requested to inquire "the reason for the clogging of the *x*-ray pipes." MR C. E. S. Phillips also replied in a light and amusing speech, in which he affected to find in Shakespeare some inkling of radiology, for in *King John* occurred the words, "I am not worth this coil that's made for me," while the reference to shuffling off the mortal coil might have something to do with the advent of tran formers.

In reply to the toast of 'The Guests," which was proposed by Professor J. Woodburn Morison, Sir Cuthbert Wallace said that years ago it was remarked that medicine stood on three legs—medicine, surgery, and obstetrics—but to these, he thought should now be added a fourth—namely, radiology. The strides which radiology had made in one generation were even greater than modern surgery had made in two. Dr T. Watts Eden, president of the Royal Society of Medicine, who also replied said that he had always felt the fascination of radiology since he first listened to the mysterious crackling of the *x*-ray tube. Nothing in modern medicine so much appealed to the imagination as the extraordinary progress which radiology had made. The radiologist of to-day fulfilled the prophecy of the evangelist: *There is nothing covered that shall* not be revealed.' The only province of medicine into which the radiologist did not seem to have penetrated was psychiatry, and it might yet be possible to elucidate the mysteries of the mental processes. But when that did come about, radiologists would be regarded as dangerous to society and burned at the stake!

TUBERCULOSIS IN MAN AND ANIMALS

TUBERCULOSIS bristles with difficulties The more attention the thinking student gives to the subject—and it matters not whether he as pathologist, bacteriologist, or clinician—the more difficulties there appear to be It is true that in the past few decades knowledge of *treatment* and *prophylaxis* has increased enormously, and information about methods of controlling the disease in cattle has been greatly extended But there are still many aspects of the problem to be solved before we can really say that we understand all about the disease We know, for example, how man *can* be infected, but, except in a few isolated cases, we do not know how he is infected We know that isolated communities of uncivilized peoples are free from the disease yet have no immunity We know that, once infected, these peoples develop tuberculosis with fatal rapidity, although in civilized countries the disease is essentially *chronic*, but *we do not* know why The mode of infection and the comparative immunity of civilized countries are two of the fundamental problems of tuberculosis which can be solved only with the greatest difficulty, and in an attempt to place our knowledge on a sounder basis Dr H Harold Scott has just produced an extensive thesis,[1] under the auspices of the Medical Research Council, in which he has employed the latest instrument of medical thought—the comparative method

The disease in animals is analogous to the disease in man It exists chronically in domesticated animals in civilized communities, but is absent, or practically so, from wild animals in their natural state When these wild animals become infected, as they often do in zoological gardens, they develop an acute fatal tuberculosis Dr Scott was for many years a pathologist in the Tropics, in both the Far East and the West Indies, subsequently he was pathologist to the Zoological Society of London During this period he performed a very large number of post mortem examinations on tuberculous human beings and animals, and in his report he has tabulated all these in detail These tables—covering 300 human cases, 70 mammals, 41 birds, and 9 reptiles—by themselves form an invaluable record, and provide a wealth of detailed information for future workers, which alone would make the report of immense value to pathology This value is increased by the addition of detailed findings in animals which have died from the double infection of tuberculosis and mycosis—numbering in all 42 birds and 9 primates It is the most complete and informative study of the acute explosive tuberculosis of non-immune hosts which has yet appeared Dr Scott's examinations indicate that when ingested in relatively small numbers, the bacilli may traverse the intestinal mucosa without causing any lesion, and pass either slowly by the lymphatic system to the thoracic duct and finally reach the lungs by way of the pulmonary arteries or, more rapidly, by the blood stream direct to the lungs from the intestine In such cases, a primary type of infection of the lungs results, appearing as though infection had arisen by the respiratory route If the infecting dose is large the morbid process is started in the intestinal mucosa, with resulting tubercles or ulcers The optimum site of development varies in different species of animals In cattle the serous membranes, especially the pleura, are most frequently affected, in pigs, the spleen, in dogs, the pericardium, in man, the digestive tract and its lymphatics, or the bones and joints In guinea pigs subcutaneous injection produces the disease in the lungs and spleen, in rabbits the lungs and kidneys, in birds the lungs are but rarely infected Dr Scott suggests that variations in the lymphatic distribution may account for this, certainly some instances of peculiar distribution in the higher apes may be thus elucidated The disease in wild animals in captivity—homologous with human beings under civilized conditions—resembles that seen in the corresponding orders of domesticated animals, with two important differences The powers of resistance are low, and the disease runs a very rapid course, dissemination takes place early, and at death, in spite of the short illness, lesions are widespread and advanced A third point, of less importance, is the almost complete absence of emaciation

Fifty of Dr Scott's cases in *wild mammals* were in primates, and three quarters of his human cases were in children under 10 years of age, the comparison of these two series is of the greatest interest In both we are dealing with "natural" tuberculosis—the disease in animals or men not immunized against the toxin The disease of the civilized adult is a modified tuberculosis characterized by fibroid changes round the lesion, by a chronicity in its course, and by being spread by continuity rather than by the lymph stream In natural tuberculosis, in both groups, there are two main forms a respiratory form, more rapidly fatal, infection causing death by generalized dissemination of the bacilli by the lymphatics and blood vessels, and an alimentary form, which is less rapidly fatal The alimentary form, of course, may also exist as a secondary infection, due to the bacilli being swallowed in the sputum The respiratory infection is much commoner, and Dr Scott believes that in the Tropics the ratio of respiratory to alimentary infection is about 7 to 1, a figure which is probably nearly twice as high as in temperate climates In the Tropics, domestic conditions are such as to encourage infection by the respiratory route

Dr Scott has many other interesting points to make about the distribution of the lesions caused by the disease and the anatomy of the host, the effect of the organism on immunized and non immunized races of man and animals, the combined effects of tuberculosis and mycosis in monkeys and birds These the student must read for himself We congratulate Dr Scott on producing a report of more than usual interest, compiled with scrupulous attention to detail It is one of the most important contributions yet made to comparative pathology, and more than justifies the use of that subject in assisting to explain the processes of disease in the highest animal

CLINICAL USE OF ACETYL CHOLINE

ACETYL CHOLINE has been known and used for many years in physiological laboratories but only recently has it been introduced into clinical use. The history of the drug illustrates the way in which researches which at first sight appear to be solely of theoretical interest, may prove ultimately to be of great practical importance. As long ago as 1906 Hunt and Taveau showed that acetyl choline produced lowering of the blood pressure in doses that were extraordinarily small but the drug was regarded as an unimportant pharmacological curiosity. Gautrelet described the anti-anaphylactic properties of the drug and suggested that it was a hormone with an action opposite to that of adrenaline. This hypothesis was confirmed by the brilliant researches of Loewi and his school, who showed that the stimulation of the vagus caused the liberation of acetyl choline in the tissues. Quite recently Dale has shown that the antidromic vaso-dilator effects produced by stimulation of sensory nerves are also probably due to liberation of acetyl choline. The physiological importance of this drug has therefore increased very rapidly during the last ten years. The physiological actions of acetyl choline had been known for twenty years before any attempt was made to apply the drug in clinical practice. The first workers to do this were Professor Villaret and Dr. Justin Besançon, who carefully studied the physiological actions of acetyl choline, and then investigated its action in disease.[1] The interval of twenty years between the physiological discovery and the therapeutic application is a striking example of the fact that although many valuable discoveries pass from the laboratory to the ward, yet they often travel at a very slow rate. It has been publicly suggested that this lag is due to physiologists not taking sufficient interest in clinical work, but there remains the alternative possibility that clinicians might pay more attention to physiology.

Although it was a long time before acetyl choline was applied clinically yet it has rapidly proved itself a drug of great value. Justin Besançon and Villaret[2] have shown that it produces most dramatic relief in a variety of forms of arterial spasm. In particular it is of benefit in Raynaud's disease and in early cases of arthritis obliterans. It is also giving encouraging results in certain cases of hemiplegia, and is of benefit in the treatment of trophic ulcers, hyperidrosis and a variety of other conditions including lead colic. In hyperpiesis acetyl choline does not appear to produce much reduction in the blood pressure but it relieves such symptoms as vertigo. The drug must be given hypodermically or intramuscularly, for it has no action when given by mouth and it is unsafe to inject it intravenously. Unfortunately it is an unstable compound that oxidizes rapidly when kept in aqueous solution. Moreover, it appears possible that oxidation produces toxic substances. Villaret points out that the preservation of acetyl choline requires precautions similar to those employed with the organic arsenicals, and recommends that it be kept in powder form in sealed ampoules. He uses it in some conditions in doses of about 1 grain (0·05 gram) and for vaso-dilator effects in doses of 3 to 6 grains (0·2 to 0·4 gram). The drug has no cumulative action because it is rapidly destroyed in the body and it appears that patients can receive daily doses for months without ill effects.

It is evident that the enterprise of these French workers has resulted in introducing a valuable and interesting remedy into therapeutics. The clinical actions of acetyl choline that have already been demonstrated are of very considerable importance and there seems a reasonable probability that a number of other clinical uses will be discovered as time goes on.

THE BEIT MEMORIAL FELLOWSHIPS

SIR OTTO BEIT, a generous and far-seeing friend to the joint cause of medical science and the alleviation of human suffering, died on December 7th. At our request Sir James K. Fowler has written the following note on the origin of the Beit Memorial Fellowship for Medical Research.

These Fellowships, as the name indicates, were founded as a "memorial" and it was the memory of his elder brother, Alfred Beit, that Otto Beit desired to perpetuate. Possibly, of all his munificent gifts for the relief of suffering and the advancement of science by the method of research, this as the years go by, will prove to have been, if not the most fruitful in results, certainly not the least so. It may be, as is now suggested to me, useful that I should briefly record the circumstances under which the Fellowships came into being. The scheme for the transfer of the teaching of the preliminary and intermediate subjects of the curriculum from eleven or twelve medical schools to two or three institutes under the aegis of the University of London, which had then but recently emerged from one of its periodical transformations, received the almost unanimous approval of the recognized teachers of the advanced and clinical subjects, but not nearly to the same degree of those concerned with the earlier, and, as some contend, more "scientific" subjects. As one of the treasurers of the Fund formed to promote it I had received from Mr. Alfred Beit a gift of £25,000 and, as appeared after his death, he had left by will a similar sum for the same object. The Faculty of Medicine on which, in the meantime the teachers of the earlier subjects had obtained a majority, advised the Senate not to proceed further with the scheme and this involved the return of the subscriptions amounting in all to upwards of £70,000, including those already mentioned. The lawyers were agreed that the gift made during the lifetime of the donor held good and reverted to Mr. Otto Beit as the residuary legatee, but as to the legacy they differed. This necessitated recourse to the courts. The University was not averse to the prospect of obtaining control of such a useful sum, and a not unfriendly suit followed. In this the Attorney-General as required by his office as guardian of the interests of "charity," a term which has in law a wide interpretation, subsequently intervened. In the first court, and again in the Court of Appeal, judgement was given in favour of those with whom I was associated who desired that both the gift and the legacy should go to the residuary legatee, as he had accepted a scheme which I had drafted, after consulting with the late Professor Starling, under which the first £25,000 was to be devoted to the foundation of three Research Fellowships in Medicine and the Allied Sciences. We naturally thought that six Fellowships were better than three. It was entirely Sir Otto Beit's own idea when he had obtained control of the whole £50,000, to increase the endowment to £230,000, and not (as he perhaps not quite seriously hinted at a later period) the suggestion of another person. This in very brief outline is a record of the origin of the Fellowships which have now gained a high position in the estimation, not only of the profession but also of the scientific world. It would be ungenerous to omit to state

that this result is largely due to the care which the Advisory Board has exercised in the selection of the candidates to be recommended for appointment by the trustees Many men of generous mind, and in a position to give effect to their wishes, have supported schemes involving the construction of imposing buildings, but Sir Otto Beit had another object in view, one which has a less obvious appeal, and this was the endowment necessary for the support of the professors and Fellows engaged in research likely to advance our knowledge of the causes of disease and to lead to their prevention, or, failing that, the alleviation of suffering and the prolongation of life He would have nothing to do with "bricks and mortar" Sir Otto never lost interest in the work of the Fellows, and at the meetings of the trustees for the review of their work and the election of candidates it was obvious that he had read with the greatest care the record of the results which the Fellows had obtained, and the qualifications of those who wished to join them The Fellowships have come of age (1909–30), the founder, alas! is no more, but his deeds remain as his own memorial

"THE TRUTH ABOUT CANCER"

IN the front of the many and various problems included under the term "cancer" there stand two confident propositions one, that in its commencement it is a local disease, and another, that in this early and local stage a complete and permanent cure may be obtained An inevitable corollary follows—namely, that delay in recognition and treatment entirely alters the position and will almost certainly be attended by disastrous consequences Such propositions are commonplaces to the medical profession, but their wide application will be made effective only when they are recognized and accepted by the general public It is the duty of the profession to protect and guide the public, and a further step in this direction—and one worthy of wide recognition—is *The Truth about Cancer*,[1] published under the authority of the British Empire Cancer Campaign No doubt to the ordinary layman the progress of cancer research as conducted by numerous workers in laboratories all the world over seems slow, ineffective, and almost non-existent, and the detection of cause and cure hardly, if at all, advanced The issues presented in such researches are most difficult and involved, and probably much time will elapse before they bring forth the eagerly desired and beneficent discovery In the meanwhile, there exists the certain knowledge quoted in the opening sentences of this note, and were this knowledge universally applied no one can doubt that the present suffering and mortality due to cancer would be very considerably reduced Because *The Truth about Cancer* will help to this end there rests with the medical profession the duty to see that the book secures the attention and interest of the general public Part of the information it conveys is directed to the prevention of cancer but in the main it faces the practical position and shows how great is the promise of early treatment and how disastrous the results of delay The constituency which the book solicits is the intelligent layman No one will depreciate the value of leaflets and tracts prepared for popular instruction, but, in the nature of things, the statements these include are blunt and dogmatic Here, on the contrary, is a volume in which what is known about cancer is presented in a fashion that appeals to the intelligence and may well engage the attention of a lover of knowledge even apart from the practical intention of its pages In view of the auspices under which it is produced, and of the authors whose help has been secured, the book speaks with authority, and evidently every effort has been made—and with success, too—to make the story lucid and readable for the non-technical public The same reasons that make it authoritative make it also careful to keep within the limits of scientific accuracy and well adjusted statement, and, naturally, anything like sensationalism is absent from its pages Here, in short, is what is known about cancer in so far as cancer creates a practical situation for the individual patient and for public opinion It is in the discharge of a high professional responsibility that this knowledge is pressed on the attention of the community, and in producing and issuing the volume the British Empire Cancer Campaign has done good service in the promotion of human happiness and welfare We offer our congratulations both on the scheme itself and on its translation into practical expression Other methods tending to the same end have their value, but in the present instance the appeal is to the thinking members of a lay audience, with the hope of informing the minds and influencing the practice of the general community In a brief foreword Lord Reading recites the various steps taken to make the book equal to the intentions of its sponsors, and these efforts have not been in vain We hope they may now be supported by the interest and good will of members of the medical profession

MATERNAL WELFARE IN NEW ZEALAND

THE maternity section of the report of the Director-General of Health for New Zealand[1] contains information on certain problems of the maternity service which are similar to those encountered in this country Recent changes have been introduced into the regulations of the New Zealand Nurses and Midwives Registration Board which require a lengthening of the course, and which will probably produce an improvement in the standard of work demanded It has also been proposed that certain of the smaller and less satisfactory hospitals shall no longer be recognized as complete training schools, and shall only be entitled to receive pupils for a portion of their course As in England, a large number of nurses take their midwifery certificate without any intention of practising as midwives, if the midwifery training centres are to be restricted the number of candidates will be too great for the accommodation, unless the unnecessary demand for midwifery certificates from nurses seeking ordinary hospital appointments can be stopped The number of cases conducted by those taking the certificate are to be increased to the number prescribed by the Central Midwives Board in this country, to enable maternity nurses to register in Great Britain if they wish Some statistics of the incidence of forceps applications show a remarkable range in different hospitals, in one the incidence being as low as 1 14 and in another as high as 57 89 per cent, with every gradation between In forty hospitals the forceps rate is over 20 per cent, and twenty-six of these are small hospitals with less than 51 confinements annually, in many of them equipment is poor, and the possibility of obtaining complete asepsis limited, so that the dangers of forceps application are much increased During 1929 nearly twice as many cases were conducted in hospitals as elsewhere, consequently, the result of hospital cases has a preponderating effect on the maternal mortality of the whole country The mortality rate varies considerably in the different types of hospital, being lowest in the seven St Helen's maternity hospitals, where it reaches 2 08 per 1,000, contrasted with this is a rate of 8 23 per 1,000 in seventy-two mixed hospitals The conclusion is drawn that the dange-

[1] Department of Health Report of the Director General of Health New Zealand for the year ended March 31st 1930 Wellington W A. G Skinner, Government Printer 1930 (1s 9d)

lies in maternity and surgical cases being nursed in the same building possibly on occasion by the same nursing staff As a logical inference from this Dr Henry Jellett (consulting obstetrician to this section of the Health Department) suggests that the general practitioner is an unsuitable person to undertake obstetrics, since a mixed practice makes him a source of danger to his patient For similar reasons he is opposed to maternity homes possessing one or more wards for emergency cases, complete segregation of both staff and patient in cases of sepsis seems to be the obvious remedy, and it is satisfactory to remember that this plan will obtain in the new Queen Charlotte's Hospital in this country, when the building is complete Opinion in New Zealand is against the giving of a bath to maternity patients on admission to hospital, and it has been forbidden in many institutions, in the new maternity hospitals in Sydney no bath tubs are provided for ante-partum patients The opinion of Professor B P Watson of the Sloane Hospital, New York, is quoted in the report, the practice at that hospital is to bathe the patient on a slab with running water, thus avoiding the menace of the full bath tub An investigation of 143 cases of puerperal sepsis in New Zealand during 1929 showed that delivery was assisted in 51 cases, with consequent internal manipulation Taken in conjunction with the statistics showing the incidence of forceps application, it seems probable that a certain number of these cases would have delivered themselves normally without intervention The report urges on practitioners the extreme importance of patience and conservative measures in the prevention of maternal mortality, a gospel which still requires to be preached in this country

MALADIES IN PNEUMATIC DRILL WORKERS

IT is a matter of universal amazement how users of pneumatic drills can stand the vibration and racket but the fact remains that they do stand it In an article on maladies from work with compressed air drills,[1] Dr Maria Sevring describes three quite distinct groups of illness or injury which are incontestably related to the occupation These are disturbances in the blood vessels, affections of the muscles, and injuries to the joints Raynaud's disease ("dead" fingers) is everywhere recognized as resulting from such work The author made a special investigation of cases among cleaners of castings and analogous processes Systematic questioning showed that an extraordinarily high percentage suffered from these "dead" or "white" fingers, with loss of sensation when they became cold All said that when they placed them in cold water (especially when the weather was cold) the fingers took on this unpleasant sensation Liability to this condition increases as the years go on Thus among all the cleaners of castings, 4 per cent suffered within two years of commencing work, 48 per cent with a duration of between two and three years 55 per cent between three and ten years and 61 per cent after ten years In one case it occurred after eighteen months After ten years, five-sixths of the cleaners of castings were affected It was most prevalent though, among those cleaners who used their air drills on very hard resisting material While this must be regarded as a vasomotor effect upon the innervation of the blood vessels two cases are cited (coming under the observation of Dr Sevring) where gangrene ensued at the end of a finger, necessitating amputation Exactly similar conditions have been described in branches of the boot and shoe industry Reference is made to one shoemaker in whom the condition led to the amputation of several fingers, a case is also cited where change of employment was necessary Two explanations of this condition are given it may be due (*a*) to vibration and contact of the hand with the cold metal, and (*b*) to the cold draught from the exhaust of the compressed air The author gives good reasons for dismissing the second suggested cause—namely, the draught—because the fingers usually affected are not those that are subject to this draught Then the left hand, which does not come into contact with the draught, is affected most, and the dead feeling comes on principally on going into the cold air or on washing with cold water The reason she considers the vasomotor changes are greater in the left hand is because it is most subjected to strong vibration of the chisel end, which is gripped very firmly The gangrenous condition of the finger referred to occurred in people of 50 years of age—that is, at an age when atheromatous changes in the arteries take place Under the heading "Affections of the muscles,' the troubles described, of which three cases came under observation, are much rarer Here again they were all cleaners of castings, who held the chisel in the left hand and the handle in the right The valve at the top of the handle has to be pressed down with the thumb, and all three said that the work required quite hard pressure constantly maintained In one, symptoms occurred after a few months' work, in another after a year, and in the third (much the worst case) after several years All suffered from marked atrophy of the muscles of the ball of the right thumb and of the muscles close by them Thus, the muscles of the thenar eminence affected in the severest case were as follows

1 Opponens pollicis abductor pollicis brevis flexor pollicis brevis supplied by the muscular branch of the median nerve

2. Interosseus dorsalis 1 adductor pollicis (only slightly affected) supplied by a branch of the ulnar nerve

3 Abductor pollicis longus extensor pollicis longus and brevis supplied by the radial nerve

Sensation was affected in the region supplied by the cutaneous branch of the radial nerve The second and third had less marked atrophy of the thenar eminences Pressure on the muscle and nerve apparently occasioned the damage Dr Sevring cites analogous instances of the damage in the region of the median nerve from excessive muscular exertion among locksmiths, carpenters, drillers weavers and cigar-makers and from the tight grip of the hammer and chisel by file-cutters, in whom paralysis and partial paralysis of the thenar and hypothenar eminences used to be common In regard to injury to the joint, several cases of this have come to light since they were first described by Holzmann[2], it has generally been described in miners hewers working with drills, etc A case in a metal worker and a riveter has been described In eight out of ten cases the right elbow was involved, the symptoms being pain and limitation of movement, especially extension In one case detachment of a piece of bone which had to be removed by operation occurred Duration of employment in one case had been three years, and in the others from six to ten years The names under which the condition is described by medical men are various "arthritis deformans,' "myositis ossificans' osteochrondritis dissecans," "chondrodermatitis,' and in other cases simply "inflammation" or deformity in the elbow-joint The importance of these observations is that the condition has now been included among the diseases and injuries scheduled under the German Workmen's Compensation Act thus Disease of the muscles, bones and joints from the use of pneumatic drills" The vasomotor disturbances—that is, the "dead" fingers—are not included in the definition

THE EBERS PAPYRUS

ABOUT 1862 the Ebers Papyrus was found in a tomb at Thebes, together with the Edwin Smith Papyrus. The Ebers Papyrus, though written about 1500 B.C., and the oldest existing written record, was a compilation of folk-lore and prescriptions going back for many centuries, even for as many as twenty. It was translated into German and in 1875 published by Dr. H. Joachim in the face of great difficulties, among them the impossibility of finding the modern equivalents of many of the morbid conditions mentioned, such as the ĀVĀ, the uXedu, and the uha diseases. The first of these has been thought to be bilharziasis or the anaemia due to ankylostomiasis. One of the most interesting sections of the papyrus is that dealing with the vascular system, for at first sight it might suggest a more modern view than is actually the case, the heart however, appears to have been regarded as a mere well and not as a pump. The account of the hair shows that fifty centuries ago the human race was wrestling just as now with the problems of grey hair and baldness, and a prescription for alopecia in the mother of a king was composed of "toes-of-a-dog, refuse-of-dates, hoof-of-ass." Dr. Cyril Bryan has placed the profession under a great debt of obligation by providing the first English version of the Ebers Papyrus based upon Joachim's German translation, and by adding introductory notes to the various chapters.[1] His chief, Professor G. Elliot Smith, has supplied a most instructive introduction, in which he quotes from Mr. Warren R. Dawson's account of the papyrus, and says that Dr. Bryan's book will disseminate much information about ancient Egyptian folk-lore, and by doing so will reveal the lacunæ in existing knowledge.

WAR NEUROSES IN THE AMERICAN ARMY

ONE of the most interesting contributions to the tenth volume of the history of the Medical Department of the United States Army in the World War,[2] the subject-matter of which is neuropsychiatry, is a paper by Major Sidney I. Schwab and Dr. Norman Fenton. In this the war neuroses are discussed as a medico-military problem, and the methods of treatment developed at Base Hospital No. 117, the most important base hospital in connexion with the care of war neuroses in the American Expeditionary Force, are outlined. While every member of the hospital staff was encouraged to work out his own technique of treatment, he could do so only within the limits set by certain general principles, which guided the practice of the hospital as a whole. It was laid down that the patients' stay in hospital was to be as short as possible, that attempts at cure should be instituted with all convenient speed—within forty-eight hours if it could be arranged, that medical officers must keep in mind the possibility that persistence of symptoms might be due to the patient's wish to remain protected by neuroses, and, finally, that work of some kind was an important adjunct to treatment and served to effect symptomatic cure. In treating cases of hysteria the view adopted was that the symptoms were the expression of a dissociation produced by either a physical or an emotional trauma. The physician's first aim therefore was to try to make the patient understand the mechanism of his neurosis, assuring him above all of the fact that this mechanism was known to be unconscious, and of the probability that the symptoms would disappear rapidly if only he co-operated in the treatment. Then followed the use of some form of suggestion treatment designed to remove as quickly as possible the cardinal symptoms, and, this accomplished, after-treatment with the object of emphasizing to the patient the fact that the symptoms had disappeared, and fixing in his mind a knowledge of the mechanism of their disappearance. Hysterical amnesias were, as a rule, treated by various soothing exercises leading back to the event for which the amnesia existed and exercised its protective influence, a small series was treated from the start by hypnosis. The anxiety neuroses were, as might have been expected, far more difficult to treat. These neuroses have their roots deep in the personality of the patient, and the conflicts underlying them offer little scope for direct therapeutic attack. The patients at Base Hospital No. 117 were subjected to what seems to have been a modified psycho-analysis, they were encouraged to talk about their experiences, to reflect upon the emotional states that accompanied them, and to examine themselves as critically as they could in the light of these events and of the physician's comments upon them. It is interesting to read that the favouring element therapeutically was the patient's own sense of his duty to return to the line. "Only in exceptional cases," state the authors, "was this ever a matter of argument or even of doubt."

ALFRED HEGAR

ALFRED HEGAR, the great German gynæcologist, was born 100 years ago, on January 6th, 1830, at Darmstadt, the son of a doctor. He studied medicine in the Universities of Giessen, Heidelberg, Berlin, and Vienna, and obtained his M.D. Giessen at the age of 22. A general practitioner in his native town, he was called to Freiburg in Breisgau in 1864 to succeed Otto Spiegelberg as professor of gynæcology and obstetrics and as director of the Frauenklinik. His clinic became a Mecca for students from his own country and from abroad, for he was a gifted teacher whose lectures were clear, straightforward, vigorous, and full of drastic humour. An indefatigable worker, he enriched his science with many original and classical contributions—such as his work on tuberculosis in the female genitalia, on ovariotomy, colporrhaphy, and puerperal fever. His book on operative gynæcology, which he brought out with R. Kaltenbach in 1874, for many years remained a standard work. To medical students who ever ask for a sign Hegar has become immortal by contributing to obstetrics one of its most valuable signs. This was first published in 1895 in the *Deutsche medicinische Wochenschrift* under the title "Diagnose der frühesten Schwangerschaftsperiode." A forceps and his well known dilators are further associated with his name. He boldly practised operative gynæcology at a time when his colleagues were timid in tackling on a grand scale tumours menacing or inconveniencing life in so vascular and difficult a region as the pelvis. Genuinely interested in the history of medicine, he wrote a life of Semmelweis in 1882. Though honours were showered upon him, he retained his simplicity. His death at the advanced age of 84, on August 5th, 1914, clashing with the advent of the world war, caused little stir in the scientific world. Hegar was tall and thin, with sharp features and rude sarcastic manner, which unsuccessfully hid a soft heart. He was kinder to his patient than to his assistants, with whom he was often very bad tempered. His great rule in practice was *Primum non nocere*.

A BULLETIN issued on December 8th states that the Ministry of Health has been in communication with the health authorities in Belgium and is informed that the recent deaths in the province of Liege are not due to any communicable disease. The occurrence is clearly a matter of local conditions, but it may be some days before the cause is fully and authoritatively ascertained.

HIERONYMUS FRACASTORIUS

AN ENGLISH VERSION OF "DE CONTAGIONE"

"In Cartolari's *Noble Families of Verona* is a list of the Fracastori who sat on the Council from 1406 to 1771, and they distinguished themselves in the law, the navy, and other professions. But only two members of the family achieved lasting fame and both followed the profession of medicine." The earlier of these two, Aventino de Fracastoro was the adviser and physician to members of the Ghibelline family of della Scala, and was a contemporary of Can Grande II. He died in 1368, and his memory is preserved in a fine tomb with a sculptured marble effigy in the church of San Fermo at Verona.

The second Girolamo Fracastoro or Hieronymus Fracastorius—his works were all written in Latin, and it was by the Latin rendering of his name that he was known among his medical contemporaries—was born at Verona about 1478, during "the first period of Venetian domination" of Verona which followed upon the fall of the Scaliger rulers. While in his teens he went to the neighbouring University of Padua, where he devoted himself, first to mathematics and, later, to medicine, studying under his father's friend Girolamo della Torre, the professor of medicine, and the latter's son, Marcantonio della Torre the professor of anatomy. Among his contemporaries at the university were many men destined to become famous, including Copernicus and, perhaps, Erasmus. This year of 1930 is "the four-hundredth anniversary of the publication of the earliest medical work of Fracastorius, the poem *Syphilis sive Morbus Gallicus*. After sixteen years of research he published, in 1546 the vastly more important prose treatise *De Contagione Contagionis Morbis et eorum Curatione*."

To Professor Wilmer Cave Wright of Bryn Mawr College the translator, to the Library of the New York Academy of Medicine, and to Dr Haven Emerson the English speaking section of our profession owes a debt of gratitude for making available a conveniently annotated edition[1] of this delightful stimulating and, indeed, astonishing book. For, to those hitherto unacquainted with the writings of Fracastorius this book written in 1546 and now for the first time printed in English, is nothing less than astonishing. What are we to think of a physician writing more than three hundred years before the discoveries of Pasteur, Lister and Koch who can thus express his views as to the nature of contagion?

> For if contagion has been correctly defined it follows that what is developed in the second thing must be of the same sort as was developed in the first thing and that the principle in the two things is the same and it must be the same in the fourth and fifth and so on in everything in fact that receives the contagion. Now in these contagions not only putrefaction must be produced but from the original germs other germs must be begotten and propagated that are similar to those former germs both in their nature and combination.

It is true that his speculations carry him off into wide vistas of obscurity, as must all speculation divorced from the control of experimental verification but who can withhold admiration from one who, without anything to guide him except the misleading concepts of his time and his own clinical and epidemiological observations, strikes forth boldly for a germ theory to explain disease? His clarity of mind recoils from nonsense as the eye closes at the menace of a blow. He seems to have some kind of protective reflex to save him from error.

> Those who invoke occult properties extricate themselves easily from these difficulties for without more ado they refer the whole nature of contagion to these properties just as they calmly answer many other questions and thus are relieved from all perplexity.

In discussing pestilent fevers, Fracastorius will not accept authority, but questions even the highest exponents of medicine of his time.

> Fevers says Montanus which are called pestilent differ in the following respect from other fevers that consist in putrefaction. The putrefaction of pestilent fevers is situated either in the substance of the heart itself or in its contents whereas in other fevers neither the substance nor the contents of the heart are putrefied.

Fracastorius says of the above:

> If one considers it carefully there are great difficulties involved. In the first place because the argument here put forward does not explain why pestilent fever are contagious though this appears to be the special peculiarity associated with them.

Montanus attributes the alleged putrefaction to a predisposition, as to which Fracastorius rejoins that

> it seems remarkable that this predisposition should exist in every one of ten thousand persons who die when there is a plague especially when we see countless persons who are perfectly healthy nevertheless catch that contagion from merely associating with the plague-stricken or with his clothes.

Perhaps one of the most amazing intuitions of Fracastorius is to be found in his speculations on rabies.

> Since then the contagion is not communicated by fomes and is not produced in the skin by simple contact but requires laceration of the skin, we must suppose that its germs are not very viscous. And since its progress is so low it might well be supposed that the contagion is analogous with either the solid parts of the body such as the nerves and the like or with some dense humour.

A note on this passage by the translator admits that "*nervi*" in Fracastorius cannot certainly be interpreted as nerves in the modern sense, nor does the expression "analogous with" quite satisfy but the induction that even this disease, capable of appearing months after laceration, is a germ disease, places Fracastorius in a unique position at a time when medical opinion on the subject was delightfully innocent. 'For we cannot believe," says Fracastorius "what many assert, and what seems to be the view of Aetius that they are so afraid of water because they imagine that they see puppies in the water."

As to phthisis a condition at that time confused with many other respiratory diseases, our author turns for light to post-mortem findings.

> For after many dissections in certain cases I have sometimes found that a part of the lungs was sound and in no way diseased another part not yet completely putrid and not yet ulcerated but still flaccid and soft and showing a tendency to decay. We may therefore call a man phthisical whose lungs are being stealthily invaded by that sort of decay but when the pituitous discharges in the region of the lungs are merely beginning to be corrupted but the lungs themselves are not yet affected then the man ought not to be called phthisical but dyspnoeic or something of that sort.

He lays stress on infection, and points out that a man who has never had any serious illness but is in excellent health" may nevertheless "contract the disease either from association with, or living with, a sufferer from phthisis or from fomes." His notes on syphilis and its treatment are full of interest for the medical historian, and display the trained wisdom of a great clinician and a profound scholar. They require to be read in the original being too extensive for a brief notice here. His description, too, of lenticular fevers while showing how imperfectly acute pyrexial conditions were differentiated in those days, is worthy of the closest study by epidemiologists.

The notes afford a valuable amplification of the text and add greatly to its interest. It seems a pity that the notes to Books I. II, and III should be separately numbered. It is a bother to turn up "Note Number 29" and find that one has looked in the wrong series. The books being so short serial numbers consecutive for the notes on all three would have been a convenience. This however, is a very minor criticism, and yet the only one which has arisen in the mind of the reviewer in perusing this extremely interesting volume. The notes themselves are excellent and speak eloquently for the vast amount of

[1] Hieronymus Fracastorius. *Contagion Contagious Diseases and their Treatment*. History of Medicine Series. Issued under the auspices of the Library of the New York Academy of Medicine. No. II. New York and London: G. P. Putnam's Sons. The Knickerbocker Press. 1930.

care and research which has been lavished on the production. The placing of the original Latin side by side and page by page with the English translation adds greatly to the value of the book, and enables the reader to seek for himself the author's own words where the meaning is obscure or the induction almost incredibly accurate.

It is interesting to contemplate the relative sterility, in its effect on medical practice, of all this correct guessing by our colleague of four hundred years ago. His right experimental verification which was destined to be deferred until some three hundred and fifty years later. To be best speculations will not save him until he can reply, like Pasteur, to his critics, "Do not attack me. Attack my experiments."

S. L. C.

MEDICAL USES OF RADIUM

REPORTS FROM RESEARCH CENTRES

Each year since 1922 the Medical Research Council has issued a report summarizing the results of research work in the treatment of malignant disease which has been carried out by means of radium salt entrusted to it by the Government. This stock of radium is distributed on loan among a number of institutions and local committees which participate in a scheme of research work organized under the general supervision of the Council's Radiology Committee. Taken together, then, these reports constitute a history of radium therapy during the vital years 1922 to 1929, they reflect more faithfully than could any document emanating from a single institution the tendencies of radium therapy and the technical advances it has undergone during that period.

The eighth report,[1] which covers the work of the research centres in 1929, deals more fully than did any of its predecessors with the treatment of oesophageal and rectal cancer. These growths are alike in at least three important respects: they are extremely difficult of access, highly resistant to radium, and often the seat of bacterial infection. Moreover, damage to the surrounding normal tissues is apt to be a dangerous complication of radium therapy in these regions.

Cancer of the Breast

At the Middlesex Hospital ten unselected cases of primary cancer of the breast have been treated during the year by a combination of radical amputation and radium therapy. This method renders possible easy access to the paths of lymphatic spread, and radium is inserted into the axilla, the supraclavicular fossa, and along the intercostal vessels of the upper five or six spaces. The immediate results suggest that the addition of such extensive interstitial radiation does not materially increase the risk of the radical operation.

At St. Bartholomew's Hospital the technique described in last year's report has been followed almost without alteration, though a wider area of breast surrounding the tumour was treated than formerly. In a rather larger proportion of cases than usual the lesion was first excised locally and radium treatment was then carried out just as though the tumour were still there. Of 82 patients treated in 1929, 38 have remained free from disease, 32 have shown local improvement, 4 are still alive but with metastases, and 8 are dead. The use of radium therapy as an adjuvant to operation is reported also from the Royal Infirmary, Cardiff, the treatment there adopted consisting in the insertion of radium tubes into the axilla at the time of operation, and subsequently giving a surface application of radium over regions possibly invaded by growth. The Irish Radium Committee, Dublin, in reporting good results from the use of the combined method in advanced cases, states that it is an advantage to eliminate the cancer mass and to bring the skin edges together so as not to leave a big area to granulate up.

Cancer of the Uterus

The statistical data set out under this heading summarize the results obtained at the various centres since 1921 in the treatment of cancer of the cervix by radium alone, the cases being classified as operable, borderline, and inoperable. The recorded survival rates compare unfavourably with those that have been published from time to time from such centres as Paris and Stockholm. None of the centres contributing these statistical data have followed the Paris technique, and only two have followed a technique similar to that used in Stockholm. The authors of the report suggest that the better results obtained at the Marie Curie Hospital must be attributed to the fact that this hospital has elaborated a method of treatment—a modification of the Stockholm technique—which differs from that adopted at the other centres. Reviewing the results of the interstitial methods of treatment, the St. Bartholomew's Hospital report states that some of the patients die from cancer high up in the pelvis with no remission of the cervix and vagina. The method is therefore, is not held to be sufficient for eradicating the deeper parts of the growth, and in future methods will be employed which entail the introduction of radium into the cavity of the uterus, combined with supplementary irradiation by means of x rays or intra abdominal radium. The cases treated at University College Hospital have shown that a complete gland dissection comparable to that in the neck is not possible, and it is suggested that implantation of radium or radon.

At the General Hospital, Birmingham, which gives a detailed report of its technique, 24 mg. of radium element are used and allowed to remain in place for seven days, thus giving a dosage of 4,032 mg. hours. Sometimes only one application is given, the cervix becoming clinically free from growth, but usually two, three, or four applications are needed. The intervals between applications vary from six weeks to six months, the period depending on the individual reaction to the rays. The glandular area, which is reached by abdominal section, usually receives an application of 2,400 to 3,360 mg. hours, this treatment being applied in the interval between the first and second application to the cervix, or at the same time as one of the subsequent applications.

According to reports from the Marie Curie Hospital and the Royal Infirmary, Cardiff, the chief complications and sequels arising from radium treatment are vaginal cicatrization, slight and transient pyrexia, vesico-vaginal fistula, recto-vaginal fistula, and vesico-recto-vaginal fistula.

Mouth and Nasopharynx

During the last five years the technique adopted for treating cancer in these regions has undergone considerable modification. Most surgeons now agree that in the treatment of cancer of the tongue needling of the primary growth is the method of choice, but they differ widely in their methods of treating the glandular area in the neck. These methods may be classified in four main groups: block dissection of the glands, leaving the radium in situ, surgical introduction of radium into the glands, surface application in the form of collars, and a combination of x rays with surface radium. At present there are insufficient data for judging the relative value of the different procedures, what is important is that those employing the methods should keep careful records of their results and of the details of their technique in each case, in order that valuable and comparable statistics may be accumulated. In the surface application of radium, for example, it is important to have precise information about the surface concerned, the dose used, the time of exposure, and the period lapsing between the treatment of the primary growth and the surface application.

[1] Medical Research Council Special Report Series No. 150. Medical Research Summaries (Reports from Research Centres for 1929). H.M. Stationery Office. 1930. (9d. net.)

The Larynx

The most detailed report comes from the General Hospital, Birmingham where the practice has been to open up the neck externally, make a block dissection of the glands, suturing the sterno-mastoid down to the prevertebral muscles by the method of Trotter, expose the lateral wall of the pharynx, and either sew the radium tubes against the outer part of the growth or insert them into position in a lead plate to the outer side of the growth area The method usually adopted is to insert five radon seeds, each containing 3 millicuries, into the growth, and to apply five tubes each containing 1 mg radium, superficially to the growth through the incision, and then having sutured the skin wound, to leave the seeds and tubes in position for seven days One detail of the technique has been found to have special value when radium tubes are applied to the outer aspect of a growth in the pharynx or larynx through an incision in the neck the soft tissues are protected from the radium by means of a sterile sheet of lead 2 to 3 mm thick, which is sewn into position At the end of the allotted time the lead and radium are removed through the wound, which is then resutured

Oesophagus

At the Middlesex Hospital four different lines of treatment have been followed in the treatment of growths in this region In a small series of cases of post-cricoid carcinoma an incision was made in the neck in front of the anterior border of the sterno-mastoid, and, the pharynx and oesophagus having been defined, the radium was inserted some behind the pharynx and oesophagus, and some against their lateral wall The needles used were 2.2 cm long and contained 0 5 mg of radium element, their number varied between eight and ten, and they were left in position in some cases for seven days, in others for ten The results were not good

In four cases intra-oesophageal application was carried out by means of a special radon applicator resembling a Souttar s tube, and in eight by means of Muir seeds on a Souttar s tube All four patients in the former group are dead in the latter, five died of the disease in periods varying from two to six months after the treatment, but of the three who are still alive only one is reported to be improved Thoracotomy was carried out in four cases The method adopted was to open one side of the chest, having just collapsed the corresponding lung and then to insert radon seeds subpleurally so as to surround the growth on three sides The first three patients died after the operation at intervals of four and a half months four months, and five weeks respectively, the fourth is still alive (eight months after operation) but oesophagoscopy shows signs of upward extension of the growth, and there is reason to believe that the end cannot be much longer delayed In none of the cases was a second thoracotomy held to be desirable The patients were old and feeble men, and though they had borne the original operation well a second seemed rather too heroic

The authors of the Birmingham report are of opinion that the only two regions in which the external approach to oesophageal growths is at all favourable are the neck and the lower part of the thorax Contrasting the danger of external operation with the implantation of radium or radon by the oesophagoscope they state that in a total number of thirty three insertions of radon there has been no immediate mortality referable to the operation Review of the year's work points to two cases which now appear to be free from disease ' This " states the report, ' is some encouragement to persevere and with further experience there is justification for expecting a larger number of similar great improvements "

Cancer of the Rectum

At St Bartholomew's Hospital growths which had extended above the peritoneal reflection at the time of colostomy were irradiated both from above and from below, in the case of infraperitoneal growths the lymphatic areas along the superior haemorrhoidal vessels have been attacked from within the abdomen A few operable cases were dealt with by the posterior barrage method without colostomy The report includes a survey of the twenty-nine patients treated before 1929 Of these eight are now alive, one remaining well and free from evidence of carcinoma four years after posterior barrage for an inoperable growth One of the cases treated at the Middlesex Hospital is of special interest Application of buried radium without operation or colostomy resulted in apparent restoration of complete comfort for some months, although the patient had had two short periods in hospital, from which he returned to work at once The partial success of this method suggests that it is worthy of further trial in suitable cases According to St Mark's Hospital report, " the satisfactory results of radium treatment of squamous carcinoma of the anus is in marked contrast to the variable response of the columnar-celled tumours " The Birmingham report stresses the value of colostomy, not only for its therapeutic effect, but also because it renders possible the recognition of hepatic metastases, and so the avoidance of useless treatment

Bladder Prostate, and Penis

Of six patients with carcinoma of the bladder treated at St Peter's Hospital three are clinically well twenty-one, sixteen, and sixteen months after irradiation, one required further treatment for recurrence after an interval of eighteen months, one developed a metastatic growth in the sacrum nine months after, and one died thirteen months after The treatment adopted in prostatic cases has consisted where possible of removing the gland surgically and inserting ten tubes each containing 5 mg of radium, into the prostatic bed and around any fragments of growth remaining The tubes have been left in place for twenty four to thirty six hours before removal through the suprapubic or perineal wound When enucleation of the gland has been impossible the needles have been buried round it With regard to carcinoma of the penis, the report states that " in both the fungating and the ulcerative forms the growth can be made to disappear by radium, but that is, of course no guarantee that the patient is cured The general state of health improves rapidly enlarged glands in the groins shrink and may disappear, the only indication for direct treatment of enlarged glands is when the skin over them is ulcerated, they should then be dissected out "

Dangers of Radium Treatment

Although it is generally agreed that every now and then a patient having unusual sensitiveness to irradiation is met with, opinions differ widely on the question whether the rays may stimulate malignant growths to activity " In this connexion," states the report, it is perhaps worth while to suggest that there are several possible modes of stimulation of malignant cells On the general principle that has been established with so many drugs, that large doses and very small doses may act in opposite ways, it may be thought that living cells can be stimulated by very small doses of irradiation In the vegetable world both positive and negative results have been reported, and some observations suggest that it is also possible with malignant cells, but such observations are too few to give any definite proof Another way in which radiation may possibly stimulate malignant growths is by giving a considerable dose to a growth already infected with bacteria Here a totally different series of events must be visualized, for the reaction of a malignant growth to irradiation is partly caused by direct action upon the malignant cells themselves and partly by indirect action upon the normal tissues of the host In the case of infected growths it is perhaps rational not to expect the normal series of reactions, and in extreme cases it may be that malignant growths do grow at a more rapid rate than they otherwise would, in spite of the damage the malignant cells themselves may have suffered from the direct radiation "

PSITTACOSIS

MINISTRY OF HEALTH REPORT

THE Ministry of Health issues this week a report entitled "A disease of parrots communicable to man (psittacosis)."[1] It has been compiled by Dr E. L. Sturdee and Dr. W. M. Scott, medical officers of the Ministry, who give a detailed account of psittacosis, and conclude that its cause is probably a filterable virus. In the preparation of this report the collaboration was secured of Drs. S. P. Bedson, G. T. Western, and S. Levy Simpson, all of the London Hospital; Dr. Mervyn Gordon of St. Bartholomew's Hospital contributes an article on virus studies in relation to this infection. In a prefatory note the Chief Medical Officer of the Ministry outlines the events which led to the focusing of attention in 1929 on this disease. He recalls the issue of the explanatory memorandum, the instituting of an inquiry by the medical staff of the Ministry, and the decision to prohibit the importation of parrots, which is still in operation.

Historical Aspects

Dr. Levy Simpson gives an interesting account of the historical study of psittacosis, and indicates its bearing on the problems of epidemiology and etiology. The first recorded epidemic occurred in Switzerland in 1879, and the disease was then recognized as presenting the symptoms and signs of both pneumonia and typhoid fever. The incubation period was estimated as being from nine to fourteen days, which is very much the same as that accepted to-day, but no evidence was obtained of human case-to-case infection. Examinations of the dead birds, conducted by Professor Eberth, were negative. The next considerable epidemic was that of 1892 in Paris, when several successive cases of pneumonia were found to coincide with an importation of parrots from Buenos Aires. The conclusion was reached that the outbreak was of human origin, and not a parrot disease transmissible to man, but a year later two family outbreaks of a similar disease in Paris coincided so closely with the acquirement of sick birds as to make a causal connexion seem inevitable. The hypothesis of psittacosis as a specific infection gained strong support from the work of Nocard on material from the birds imported in 1892. In the bone marrow of dried wings of parrots which had died on the voyage he found a peculiar short highly motile Gram-negative bacillus, resembling organisms of the Salmonella group. A review in 1906, by Gilbert and Fournier, of the psittacosis outbreaks in France resulted in the appearance of a good clinical account of the disease in human beings, and the recognition of the possibility of infection from man to man. Dr. Levy Simpson describes the epidemics of psittacosis in Germany in 1896 and 1898, in the United States, in South America, and in England. He concludes with the expression of a strong opinion that all lines of investigation—namely, the epidemiological, clinical, pathological, and bacteriological—point to the abandonment of the erroneous hypothesis of specific infection, and incriminate a filterable virus detected by the work of Drs. Bedson, Western, and himself.

Epidemiology

The recent widespread epidemic of psittacosis is alleged to have arisen in Brazil, but no human cases have been reported from that country. This is not considered surprising because the disease does not probably assume epizootic proportions among birds in the wild state, in wooded tropical countries, moreover, the dead bodies of birds are quickly destroyed, and are unlikely to infect human beings. The case is, however, altered when the birds are living in captivity, and details are given of the bad sanitary conditions which have been prevailing in this connexion. Dr. Mervyn Gordon mentions that the birds at the Zoological Gardens are kept under the best hygienic conditions, and that infectious diseases are thus prevented from spreading in the same way as is possible during transport to this country. In addition to Brazilian parrots, grey African parrots have apparently been the cause of infection sometimes, three cases were due to love-birds, and one to a canary. Several cases from the Argentine have been attributed to sick thrushes. Mice and domestic fowls have been experimentally infected with material obtained from fatal human cases, and from parrots and budgerigars, but no human cases have been traced to a subsequent infection. The length of time during which a parrot may remain in a subacute infectious condition has not been fully determined, but it has been shown that the dead birds remain infectious for a very considerable number of months.

The evidence in favour of occasional human transmission of the disease seems to be unassailable, but no instance of infection of hospital nurses in attendance on psittacosis patients has been recorded in England, probably due in part to the insistence on such precautions being taken as are observed in cases of typhoid fever. House epidemics have characterized outbreaks of psittacosis, distinguishing them from influenza epidemics and pandemics. No case have occurred where there has been no association with infected birds or patients. The curious immunity revealed among those engaged in the bird-fancying trade has attracted some attention, but the opinion is expressed that this may have been due in part to faulty diagnosis. Psittacosis is not an invariably fatal disease, and it is possible that one attack confers lifelong immunity, moreover, the report suggests that a person whose contact with birds is part of his usual employment will not generally come into such close contact with them as will a private owner, who caresses his pet parrot, feeds it from his mouth, and allows it to climb over him. Cases of psittacosis have, however, been reported among persons professionally interested in birds, and the apparent immunity to infection of the bird fancier cannot be held to detract to any extent from the value of the evidence in favour of this disease being conveyed by sick birds. Young children seem to be less susceptible than adults, and in the English series only four patients were under the age of 10.

Clinical Aspects of Psittacosis

A valuable description is given of the clinical manifestations of psittacosis in man, based on a study of about eighty cases. The duration is said to be about two or three weeks, but in a few instances the symptoms continued with maintained pyrexia for as long as eight weeks. Convalescence is nearly always protracted and tedious, and may be interrupted by temporary relapses or by thrombosis of the femoral vein. The incubation period appears to be usually about ten days, but may be as short as four or as long as sixteen. At first the patient feels comparatively well in spite of high fever, epistaxis, chills, and generalized pain. Towards the end of the first week profound exhaustion ensues, and the patient becomes both somnolent and intermittently irritable. A troublesome paroxysmal cough appears and persists through the second week. Crepitations and scattered rhonchi are heard in the lungs, and patchy areas of consolidation develop, fusing together so as to involve considerable portions of one or both lungs. During the second week the patient may be semi-comatose; muttering delirium is usually present, and may alternate with periods of restlessness, or even violent excitement. When the prognosis appears to be hopeless the temperature sometimes begins to fall by lysis and signs of improvement are seen. Mild, and even ambulatory, cases occur, but there is uncertainty as to what determines the degree of resistance of the patient. Epistaxis occurred in about 25 per cent. of the cases, usually on the first day. Headache was a constant feature at the beginning of the illness, reaching its maximum intensity in about ten days, and then gradually diminishing. The site was variable, but was usually frontal or occipital. Sore throat was frequent, and might be very severe, the fauces and soft palate were red and congested, and sometimes there was a yellowish exudate. Sordes of the lips were not unusual, and herpes

[1] Ministry of Health. Reports on Public Health and Medical Subjects. No. 61. A Disease of Parrots Communicable to Man (Psittacosis). By E. L. Sturdee, O.B.E., M.R.C.S., and W. M. Scott, M.D. London: H.M. Stationery Office. 1930. (2s. 6d. net.)

labialis occurred in a few cases Cough was a common feature it gradually increased in intensity until the paroxysms shook the whole body, leaving the patient entirely exhausted preventing sleep, and aggravating the headache The expectoration in most cases was very scanty and sometimes absent The sputum was usually mucoid, but might be mucopurulent or frankly purulent examination of it revealed not infrequently a secondary infection of the lungs One of the remarkable features of the disease usually was the absence of rapid or deep breathing even when the physical signs indicated extensive pulmonary involvement Rapid respiration when present appeared generally towards the end of the second week, in no instance was orthopnoea present The pulse was relatively slow compared with the temperature and this disproportion persisted in most cases throughout the illness A typhoid state" was common in all the severe cases and the gastro-intestinal tract was usually involved to some extent Rose spots, or similar skin lesions were noted in nine cases The mortality rate was about 20 per cent Prognosis was difficult, but marked involvement of the nervous system foretold a dangerous illness and absolute coma usually ended in death Rigors though often dramatic and repeated, were found to have no prognostic value

Pathological Findings

The changes found at necropsy were those of a general septicaemia together with an inflammatory condition of the lungs in some cases recalling the influenzal pneumonia of 1918 The lesions did not conform with those of classical lobar pneumonia or of broncho-pneumonia There was usually intense engorgement proliferation, and desquamation of epithelium, leucocytic infiltration and increasing haemorrhage This was followed by an abundant exudate at first serous but later becoming fibrinous and an increasing capillary thrombosis extending to the pulmonary arteries The consolidation was of the lobar type with practically no polymorph reaction Though the bronchioles were involved with the rest of the lung substance nothing was found to suggest that the lesion was specially related to them Areas of degeneration and haemorrhage were found in the muscles, chiefly the rectus abdominis The kidneys and liver showed parenchymatous degeneration and a diffluent red septic spleen was a common finding The stomach and intestines nearly always escaped any severe lesions Congestion and oedema of the brain and spinal cord were not infrequent

Etiology

The second part of the report is devoted to a detailed record of experimental observations by Drs S P Bedson and C T Western They studied human cases in the recent epidemic examined patients associated with them and inoculated birds with infective material their experimental work being controlled by the observation of parrots unconnected with any cases of human illness An account is given of the steps by which the conclusion was reached that a filterable virus was concerned It was found that the psittacosis virus withstood desiccation and the action of diluted glycerin, as well as the addition of a small quantity of ether Exposure for thirty minutes to a temperature of 50° C inactivated most of the virus but not always all of it It was shown that the virus was capable of passing through the Seitz filter, but that probably a good proportion of it was stopped

An outstanding feature of Dr Mervyn Gordon's experimental work was the discovery that strains of virus maintained and even increased their violence by passage through mice Dermotropic and neurotropic affinities displayed by this virus for rabbits after mouse passage, suggest that it may belong to the same group as the herpes virus this is a problem specially noted in the report as calling for further investigation The virus derived from the human cases did not display the same degree of pathogenic capacity or stability for mice as that obtained from parrots, and it is suggested that the mouse may perhaps be a more valuable means for the isolation and study of viruses than has hitherto been realized

England and Wales.

London School of Medicine for Women.

THE annual dinner of the London (Royal Free Hospital) School of Medicine for Women took place at the Savoy Hotel on December 4th with Mr Malcolm Henderson presiding About 450 sat down at the tables The toast of "The School and Hospital" was in the hands of Mr St John Ervine who confessed that he had been brought up to think that a woman doctor or indeed, any educated woman was a forbidding person with a glum look, and that she had probably taken to learning only because she could not take to marriage That was still the opinion of many men of the world—a rather ignorant body of men—and he would like to bring them into the present company and let them have a look at a gathering of women doctors, when their prejudices would be quickly dispelled He suggested that one of the main reasons why women had become so closely connected with medicine was that they were discontented with the lighthearted treatment by men of female aches and pains In conclusion Mr Ervine paid a tribute to the great woman attached to the London School of Medicine for Women (Dame Mary Scharlieb) who had just passed away He felt that one had said almost everything that need be said about the hospital and school in remarking that out of it came a noble woman who did noble things Mr Malcolm Henderson in replying to the toast, said that there was no need to affect modesty in speaking of what the hospital and school had done during the present year This year the hospital and school were entering into an agreement which was virtually a permanent one—at all events, it was to last for fifty years—and he was sure this closer union would be happy The year had also been memorable by the opening of a new wing of the hospital thanks to the great generosity of Mr Eastman *Lord Riddell* and Sir Albert Levy This new wing would enormously increase the scope and usefulness of the hospital He thought it rather remarkable that in these troublous times the entries to the school should not only have been maintained but increased in number For his own part he felt extraordinarily honoured in having been associated for twenty-five years on the council of the school with the women to whose courage and wisdom and unbounded faith in the cause all this had been due Mr L E C Norbury proposed the health of the guest coupling with the toast the names of Mr Kinnell who had done excellent work on the Hospital Board and was chairman of the Appeal Committee on behalf of the Extension Fund and Lord Moynihan, President of the Royal College of Surgeons Mrs Kinnell in responding said that it was always a great pleasure to be associated in any way with the School of Medicine of the Royal Free Hospital A few weeks ago Mr Baldwin had remarked that women in higher education were not as fortunate as men in that they had no traditions but there was something in life which was even greater than inheriting a tradition and that was to create one Lord Moynihan, in response said that women not only in medicine but everywhere else were making better day by day The year 1930 had been a women's year Their recent achievements had made him think that women were capable of the greatest things in life It had been said by many people that no woman would ever make a surgeon because her courage would fail at the critical moment He happened to meet one of those challengers only that afternoon, and said to him, "When two people were stranded in the straits of Messina last night it was the woman who swam ashore" As to the future of women in medicine he thought they had not yet quite found their role They had the most marvellous sense of intuition and he hoped their great faculties would be exercised in a far larger measure than had yet appeared in laboratory research In that, and also in certain other technical directions, he believed there was a very great future open to women The final toast, that of "The Chairman" was proposed by Miss Waller, and after the chairman's brief reply, the dinner was followed by a dance

Home Ambulance Service

The report of the Home Service Ambulance Committee of the Order of St John and the British Red Cross Society for the quarter ended September 30th, 1930, describes some of the provisions of the Road Traffic Act, 1930, for the information of those in charge of motor ambulances, including the procedure that must be adopted by drivers of motor vehicles on the occurrence of accidents It is inferred from the first schedule to the Act that motor ambulances are not subject to any specific speed limit, they are also explicitly exempted from the provision restricting the time during which drivers of certain vehicles may remain continuously on duty When an accident occurs, causing damage or injury to any person, animal, or vehicle, the driver must stop, and if required by any person having reasonable grounds for so requiring, give his name and address, the name and address of the owner, and the identification marks of the vehicle Where these particulars are not given, he must report the accident at a police station or to a police constable as soon as possible—in any case within twenty-four hours of its occurrence These requirements are dealt with in Section 22 of the Act The committee also draws attention to the means by which co-operation may be effected between the ambulance service and public authorities Some county councils are stated to have already made substantial grants towards the provision and maintenance of new ambulances at home service stations At the date of the report the committee had 338 ambulances at its disposal, including ninety-two affiliated stations The number of patients carried during the quarter was 29,182, bringing the total number carried since the service was instituted in 1918 up to 930,633 A comparative table of work done in counties of England and Wales, and in Northern Ireland and in the Irish Free State, is printed at the end of the report

Royal Surgical Aid Society

The Lord Mayor of London, who was accompanied by both Sheriffs, presided at the sixty-eighth annual meeting of the Royal Surgical Aid Society, held at Carpenters' Hall on December 3rd The report stated that last year the society had had an increase upon the previous year's income, which itself was a record, the total sums received being £58,497 in the way of ordinary income and £4,822 in legacies During the year the society had assisted 31,937 patients and had supplied 42,704 surgical appliances It was added that the remarkable growth in the practical work of the society in recent years was largely due to co-operation with the approved societies in the distribution of additional benefits in the direction of the provision of surgical appliances for their members The Lord Mayor warmly commended the society, saying that it was most gratifying to find in these days of widespread depression and growing taxation that the society was receiving such consistent and increasing financial support Sir Crisp English, in moving a resolution of thanks to the surgeons on the society's staff, said that the surgeons themselves were to be congratulated and envied on the most delightful and attractive work they were doing The medical profession was sometimes said to be an arduous vocation, but it was certainly one which brought great happiness to those who followed it, and offered to them many privileges and satisfactions He considered that the Surgical Aid Society was one of the antidotes to the spread of bolshevism, for by its means the poor man could provide his crippled son with the same special appliances as the rich man could secure Surgical convalescence was a slow business It was said that 'illness arrived on horseback and departed on foot'' and that applied especially to surgical cases In helping individuals the society was often helping an entire family relieving it of a great economic handicap, and thus the value of its work was multiplied It was appropriate that the meeting should take place in Carpenters' Hall for the surgeons were indeed master carpenters to some purpose The vote of thanks was heartily carried and Mr Mumhead Little one of the surgeons, said a few words in response Other speakers were the Archdeacon of London, Sir George Penny, M P , and the Sheriffs The announcement of the sudden death, as the result of a street accident, of the society's treasurer, Mr J R Cooper, a day or two before the meeting, caused a painful impression

Consolidation of Enactments.

In pursuance of the policy of consolidating the various statutes regulating the work of the Ministry, the Minister of Health has appointed a committee with the following terms of reference "With a view to the consolidation of the enactments applying to England and Wales (exclusive of London), and dealing with (a) local authorities and local government, and (b) matters relating to the public health, to consider under what heads these enactments should be grouped in consolidating legislation and what amendments of the existing law are desirable for facilitating consolidation and securing simplicity, uniformity, and conciseness" The chairman of the committee is Viscount Chelmsford, and the Secretary is Mr J King-Farlow of the Ministry of Health

Scotland.

Health of Scotland

THE third quarterly return of the Registrar General for Scotland during the year 1930 reveals that 22,851 live births were registered during the period This number is 1,865 less than in the previous quarter, 1,130 less than the average number for the third quarters of the preceding five years, and 3,389 less than the mean figure for the third quarters of the preceding ten years It is the smallest number of births registered in Scotland in the third quarter of any year Of the births registered, 11,602 were males and 11,349 females, the ratio of male and female children being 102 2 to 100 This ratio is the lowest recorded for many years The highest birth rates were in the north-eastern and south-western parts of the country, the highest county rate being in Kirkcudbright Deaths registered in Scotland during the third quarter numbered 13,353, being 2,533 fewer than the average number for the third quarters of the preceding five years, and 114 fewer than the mean figure for the third quarters of the preceding ten years The general death rate for the quarter was 10 9 per 1,000—2 2 below that for the previous quarter, and practically the normal death rate for this quarter of the year The lowest county death rates were 9 0 in West Lothian and 8 2 in Stirling Deaths of children under 1 year of age numbered 1,358, and were equivalent to an infantile mortality rate of 59 per 1,000 registered births This is the lowest infantile mortality rate yet recorded for any quarter in Scotland since 1913, the earliest year for which quarterly infantile mortality rates are available The corresponding infantile mortality rate of the quarter in England and Wales was 45, and in Northern Ireland 51 Of the total deaths registered during the quarter, 453, or 3 4 per cent, were attributed to the principal epidemic diseases Deaths from all forms of tuberculosis numbered 939, constituting 7 0 per cent of the total deaths This is the lowest quarterly death rate from tuberculosis so far recorded in Scotland Deaths from malignant disease numbered 1,877, representing 14 1 per cent of the total deaths for the quarter, this rate is the highest yet recorded in any quarter The number of deaths from diseases and accidents of pregnancy and childbirth was 154, which was the same as in the third quarter of last year

Retirement of Dr R. M Buchanan

A meeting of the medical and laboratory staffs of the Public Health Department of the Corporation of Glasgow was held at the Sanitary Chambers Glasgow, on November 27th, to present a gift to Dr R M Buchanan on the occasion of his retirement from the office of city bacteriologist—a post which he has held for the last thirty-one years Dr A S M Macgregor, medical officer of health for Glasgow, occupied the chair The presentation was made by Dr W R Wiseman, who said that Dr Buchanan's name had become in Glasgow almost synonymous with the term "bacteriology" This was not surprising, since he had been

associated with the application of that science to the problems of public health through a long period of great development Dr Buchanan had remarkable powers of observation He loved to observe and describe the minutiæ of objects that came under microscopical investigation His entomological studies revealed a rare taste and delicacy in manipulation and many of these objects would be left in the laboratory for their enjoyment and edification Besides being an acute scientific observer, Dr Buchanan was also a man of affairs—a combination which might account for his tact and for the care and prudence that distinguished not only his scientific work but his conduct in the ordinary affairs of life Another characteristic was his keen sense of humour which was not an unimportant factor in producing efficient service To the interests of his profession he had shown an unremitting devotion and to his colleagues a marked generosity in imparting the valuable results of an extensive and varied experience His familiar figure would be much missed in the department where his influence would long be apparent These remarks were supplemented by the chairman who referred to the notable service Dr Buchanan had rendered during the Pasteur centenary in Glasgow and to the admirable manner in which he had carried through the Lister celebrations while president of the Royal Faculty of Physicians and Surgeons When the British Medical Association met in Glasgow in 1922 Dr Buchanan was president of the Section of Microbiology and in recent years he has held office as president of the West of Scotland Branch

Royal Edinburgh Hospital for Incurables.

At the annual meeting of the Royal Edinburgh Hospital for Incurables held on November 28th Professor D P D Wilkie, of the surgical department in Edinburgh University gave an address dealing with the work of the hospital As medical science advanced he said, the group of diseases previously regarded as incurable was being steadily reduced With a fuller knowledge and experience of the use of radium it was now possible to benefit cases of cancer which were formerly classed as incurable As the public came to recognize the necessity for the early treatment of this disease fewer patients would have to seek admission to such hospitals Radium, however, was no panacea for cancer and for many years to come the Longmore Hospital would have to deal with many cases of incurable malignant disease Mr J J Herdman chairman of the Board of Management said that during the past year 330 patients had been treated in the wards of the Longmore and Liberton Hospitals belonging to this institution Of this number 92 had died and 32 had been discharged or had left of their own accord The number of applications received during the year was 219, of this number 126 had been received into the wards 3 were declined as unsuitable and 23 had died before beds were available for them Of the 219 applicants 82 suffered from cancer of the breast it was found possible to admit only 55 In regulating admission cases were judged according to medical and domestic urgency Lord Provost Whitson in moving the adoption of the report said that the growth of the Longmore Hospital had been a wonderful record of patient achievement backed by public generosity for nearly fifty-six years The annual subscriptions which were only £3 890 were just about one fifth of what was required each year and he commended the institution to the support of the public

Physical Education.

In a lecture recently given in Edinburgh under the auspices of the Combe Trust on 'The influence of posture carriage and habits on health' Mr W A Cochrane said that many of the obscure and distressing conditions which called for treatment were signs of a derangement in the elaborate mechanism regulating and maintaining the upright position of the body The attainment and maintenance of this fully erect position was one of the goals of human development in this respect the apes might be regarded as failures The power to maintain a fully erect posture was not strongly inherent in the human being for the human infant took a very long time before he could stand and walk Among many weak people the muscle tone and sense of balance were so poor that correct posture was never fully acquired In this connexion the physical educator had an important duty in teaching the proper way to stand sit and walk erectly When they stood up they depended upon the balanced postural tone of the extensor muscles of the spine and limbs, this kind of muscular action was quite different in its nervous control from that which served the ordinary contraction of muscles For this reason ordinary games and athletics did not appeal to this mechanism and were not fundamentally complete in giving a person on the proper basis for physical health and efficiency The neuro-muscular mechanism, which controlled the anti gravity and respiratory muscles had also to be trained This training was supplied by the remedial gymnast and the lecturer thought that his special knowledge should be made use of by an improved system of physical education in schools and colleges It was possible, with a reasonable amount of study and concentration, to learn the essentials of good bodily mechanics and posture in a short time A person so trained was fitted to stand the strain of life in the best possible way True physical education was a mental process increasing in value with increased mental development Ordinary drill, games and athletics should be built up upon a basis of good posture, if this were not done they might be positively harmful

Veterinary Teaching in Glasgow

The annual distribution of prizes at the Glasgow Veterinary College was held on December 4th when Professor Glaister delivered an address He said that the Glasgow Veterinary College should not be regarded as a parochial institution for the eighty-eight students attending the college were drawn from a wide area over the South and West of Scotland, as well as from the North of Ireland, England Palestine India, and other countries Several years ago the Government had decided to give a grant only to the veterinary college in Edinburgh on the ground that there was room in Scotland for only one veterinary college There were three considerations which justified the existence of the Glasgow College In the first place a steady supply of new students was maintained in the present year thirty new students had joined the college which was founded over sixty years ago Secondly, its efficiency was well authenticated by the fact that its students attended the examinations of the Royal College in London The third test was the efficiency of the teaching staff and the facilities provided for tuition After the withdrawal of the Government grant friends in the West of Scotland had rallied round the college and the governors had been able to keep it going Lord Provost Kelly who presented the prizes expressed the opinion that Glasgow was an ideal centre for veterinary teaching and research, since it was situated in the middle of a large stock rearing area

Belgium.

[FROM OUR CORRESPONDENT]

The Campaign Against Acute Poliomyelitis.

WITH a view to controlling outbreaks of acute anterior poliomyelitis the Government has decided to undertake in Belgium under the supervision of M Bordet the preparation of horse serum according to Professor Pettit's formula and to arrange for the supply of ape serum from the Pasteur Institute in Paris These serums will be placed at the disposal of medical practitioners who wish to investigate their action It is proposed also to organize on the largest possible scale the collection storing and distribution of convalescent serum on the lines laid down by Netter To obviate any difficulty in obtaining convalescent serum when urgently required a scheme has just been brought into being to ensure constant touch being kept between medical practitioners and patients who have recovered from the disease and are willing to supply blood Any person who has had poliomyelitis even though the attack was slight or abortive, will be notified by his doctor

of the opportunity for service which is open to him, and invited to undergo the trivial procedure of blood withdrawal, payment for this being eventually forthcoming from the State The blood will be collected by provincial and university laboratories, which will make arrangements to store the serum The directors of these institutions will reserve half the quantity removed from each patient for the use of the practitioner concerned, and will not dispose of it without his authorization The remainder of the serum will be sent to the central laboratory for distribution throughout the country as may be required

National Health Insurance

Resistance to the proposed legislation for national health insurance is continuing in view of the threatened restriction of the liberty of the medical profession The Joint Assembly of Brussels Practitioners has had the happy idea of calling a meeting of the Belgian profession to acquaint it fully with the legislative proposals before Parliament More than 700 doctors from Brussels and the provinces accepted the invitation and displayed keen interest in the position in view of the threat to various lines of medical practice The following proposals were enunciated by Dr Koettlitz as indicating the attitude taken by the Medical Federation of Belgium Free choice of doctor must be absolute—that is to say that every medical practitioner, whether a member or not of a professional association, can participate in the service, provided he undertakes to abide by the decisions of the commission of arbitration The insured person will pay his doctor directly, a minimal regional scale, approved by the Federation, will be established by the professional society, which must have existed for at least ten years and contain a minimum of 500 members Professional secrecy must be absolute and inviolable, both directly and indirectly Payment is to be made on behalf of every sick person, whatever his condition or the nature of the treatment afforded, and whether such treatment is given at the doctor's house, the patient's house, in a State or private hospital, or in any other medical establishment There must be absolute freedom as regards treatment and prescribing within the limits at present in force Control of the patients remains in the hands of the society, and of the doctors in those of their colleagues, any dispute between the doctor who gives the treatment and the medical officer of the society being settled by the commission of arbitration Professional medical associations must be more adequately represented on the administrative technical commissions established by law This representation is defined in the law by Articles 25 and 27, and is considered to be at present flagrantly insufficient The medical organization indispensable for satisfactory functioning of the insurance scheme will be organized and conducted by the National Office of Public Health co-operating with the Belgian medical profession, represented by the usual medical federations, which will have a preponderating representation A reason for the creation of this autonomous body is that it will obviate a repetition in Belgium of the faults which have been found in all the countries where insurance schemes are in operation Elsewhere the money of the insurance societies has been largely used to erect magnificent buildings for administration—a purpose for which these funds were not intended The insurance funds, whatever the source from which they come must only be employed for clearly defined purposes, this will be safeguarded by the National Office

An International Military Medical Organization

The Belgian Government called a meeting in July, at Liege of the heads of the medical departments of the Military Naval and Air Forces to discuss the creation of an International Medico-Military Records Office, and also the possible educational value likely to accrue from the interchange of military medical officers of different countries the resolutions passed by this meeting have been communicated to the other Governments It is proposed to establish an international office to house medical records relating to the military, naval, and air services, this office to be in close association with the permanent committee of the International Congresses of Military Medicine and Pharmacy in Belgium Its services would be freely at the disposal of those nations which join in establishing it contribute to its supply of records, and share in the cost of its upkeep according to the scale drawn up by the League of Nations The idea of arranging international visits of medical officers of the three services was similarly approved, provided that some system of definitely graded instruction is adopted, or a plan is devised of sending delegates to meetings in other countries according to the customs prevailing in them, the new office might act as a central bureau of information in facilitating such interchanges The work of bringing these decisions into effect has already begun, and the permanent committee of the International Congresses of Military Medicine and Pharmacy (which are to meet together at The Hague on the occasion of the sixth congress next June) will be charged with the approval and the drafting of the lines on which this new Records Office shall function

First Aid in Road Accidents

The Ministry of Public Works has authorized the establishment of a series of telephonic call-boxes on the main roads, whereby assistance may be procured for persons taken ill or involved in accidents In the first instance the roads to be thus equipped are those from Brussels to Ostend, Antwerp, and Esschen, to Liege and Herbesthal to Namur, Arlon, and Stolpenich, and to the French frontier, passing through Mons Travellers along these roads will find at intervals telephone boxes connected night and day with first-aid posts ready to supply at any point such prompt help as may be necessary in accidents or other emergencies This service will also be available for the local police and Government services

Correspondence.

ROYAL MEDICAL BENEVOLENT FUND

Christmas Gifts

SIR,—On November 8th you very kindly published my letter asking for donations to enable this Fund to give a Christmas gift to the most necessitous of our beneficiaries I gratefully acknowledge the receipt of £120 in response to my appeal, but I need the sum of £550, if no one is to be left out May I ask your readers to help me to find the balance still required, so that there may not be disappointment in the homes of those of our colleagues whom this Fund is trying to help Cheques should be forwarded to the Treasurer, Royal Medical Benevolent Fund 11, Chandos Street, Cavendish Square, W 1, as soon as possible, in order that our gifts may be distributed before Christmas Day —I am, etc,

THOMAS BARLOW,
President

December 8th

THE WORK OF LABORATORIES

SIR,—I am sorry that Lord Moynihan should resent the very mild quip I made at his expense lately, when the new laboratories of the Hospital for Tropical Diseases were being opened I remarked that when a prominent surgeon had chosen "to belittle the work of laboratories, to declare physiologists to be aloof from medicine, and to be somnolent," at the opening of the new Institute at Toronto, founded actually to commemorate the laboratory work of Banting and his colleagues in physiology and biochemistry, he seemed to have used "an Irish mode of encouragement" that we need not imitate

He now complains to my great surprise that this gave "a corrupt version" of his meaning If he did not belittle the recent work of British laboratories I do not understand the English language His defence of himself by quoting from his address other sentences to which I did not refer is like defending the occasional tippler by quoting his moments of sobriety A large section of his address was labelled "Physiology Lagging Behind," and in this he boasts that "we, the clinicians, have gained gigantic intellectual victories with barely recognizable assistance from the laboratory" He must not run away from the fact that "aloofness from medicine" and "somnolence" were actually his own words They were used

that gave rise to a good many smiles on the other side of the Atlantic, and some consternation in Canada as I found there long before I had read Lord Moynihan's address myself

Let me appeal to obviously impartial comment I do not find that the *British Medical Journal* paid attention to his address In a leading article in the *Lancet*, however (October 11th p 806), I read 'Let us pass finally to Lord Moynihan's complaints about the physiologists—that they have neglected hominal research, that they are aloof from medicine, that their science is playing truant We believe that his contentions are mistaken, or at least greatly exaggerated' It is not only I then who have corrupted his meaning there seems to be a general conspiracy against him

He resents my saying also that "he thought the idea that the laboratory workers did or could, hand over new weapons for the physicians to use was laughable" I must refer your readers to his address I do not take up this point now beyond noting that Lord Moynihan quoted a rhetorical question in his address and pretended that it had been asked in serious doubt and without a reply to it having been supplied The less said of that the better Sincerely and whole-heartedly I admire the eloquence and moving beauty of great parts of his Toronto address I deplore all the more for his own sake—as I have told him—that he entered on that occasion into some controversial paths outside his own field of work I have given friendly expression to him in private of my opinion of some of the methods of argument he used As he knows I am debarred by my office from making public answer as to those though I (naturally) cherish a belief that the answer might be complete and devastating I am free however to speak of his disparagement of our physiologists and biochemists as such and at least of his choice of a place and time for indulging in it If I forgive him now for his quite baseless charge against me of perversion he in his turn must pardon me for my friendly chaff His telling the Canadian workers that their friends and colleagues here doing work exactly like their own, are somnolent aloof from medicine and lagging behind the clinicians certainly seems to me to offer one of those occasions when, as Michael Finburn said, 'there is nothing like a little judicious levity"—I am etc,

Kensington W.8, Dec 8th WALTER M FLETCHER

CARDIO-VASCULAR SYPHILIS

SIR,—The paper by Dr Carey Coombs upon this subject in the *British Medical Journal* for November 29th is of great interest Perhaps I may be permitted to comment upon a few points which seem to be of practical importance

Dr Coombs states that cardio-vascular syphilis does not declare itself by symptoms until about twenty years after the primary sore That is approximately true in so far as pathognomonic symptoms are concerned, but it is not true in respect of clinical signs These signs may be slight, and they may suggest at the first glance nothing more than a vague 'something" wrong with the heart but that is the time when it is most important to make a diagnosis—not so much of any particular heart lesion as of the syphilis itself It is in this stage while the cardio-vascular damage is slight and reparable, that adequate therapeutic measures can prevent a future grave aortitis and aortic valve incompetence Properly considered syphilis is—even from before the appearance of the primary sore—a cardio-vascular disease It is that, first last, and all the time A careful examination of patients suffering from early syphilis—from the sero-negative primary till the end of the secondary stage—will reveal in a very high proportion some clinical evidence of cardio-vascular damage And it has always to be borne in mind in this connexion that the visceral damage wrought by syphilis is invariably very much more severe and extensive than clinical signs would suggest Another point is that in every case of cardiac or vascular disorder syphilis should be considered and great pains should be taken to decide as to whether or not it is an etiological factor in the case

I would endorse most strongly the plea for a very careful consideration of the patient's history, that of his wife, her pregnancies, and their children Both marital partners and the progeny should be examined both clinically and serologically In the presence of a negative Wassermann test, and indefinite clinical findings in a patient, a syphilitic etiology may be uncovered by investigating the family There is I believe, no such thing as a completely asymptomatic syphilis The ensemble may give a clue which the therapeutic test will clinch A caution about the use of potassium iodide is necessary Iodides have no treponemicidal power, their sole function being the dissolution, or prevention of formation of fibrous tissue The pathological picture must be visualized in every case, because, if the fibrous tissue is exercising a protective function—for example in aneurysm, where it may be the sole rampart between the patient and death from rupture—dissolution of it by the exhibition of iodides may precipitate a fatal issue If the fibrosis is non protective, iodides should be given in large doses—90 grains of the potassium salt daily

Treatment should invariably be commenced with a fat-soluble bismuth salt such as bivatol, given intramuscularly in 2 c.cm doses twice weekly for eight weeks This should be succeeded either by myosalvarsan intramuscularly once weekly for eight weeks, or, if trouble is experienced by the oral administration of stovarsol The whole course should last for seventy-two weeks without any rest period, the patient receiving 23·25 grams of myosalvarsan and a quantity of bivatol equivalent to 5·12 grams of the elemental bismuth When these remedial agent are available, and are tolerated the giving of mercury is only a waste of time It is indeed astonishing to find that no mention of bismuth is made either by Dr Coombs or in the leading article on the subject on page 919—I am etc,

December 1st J TYTLEP BURKE,
Director of Municipal Clinic (V D)
City of Salford

AVERTIN ANAESTHESIA

SIR,—The discussion on avertin in the *Journal* has focused attention on some important questions but in the end the relative value of this drug can be adequately tested in one way only—namely by comparing it with other anaesthetics over large record of *comparable* cases In a recent paper[1] on avertin anaesthesia I suggested that at the present moment our lack of knowledge tends to place us in the invidious position of refusing the service of one anaesthetic because of the dread of immediate disaster when in reality by our choice we may inadvertently be multiplying many times the total risks to our patient Only by an assessment of the total advantages and disadvantages including the risks per 1,000 cases both immediate and from such subsequent causes as toxaemia and lung complications inherent in each anaesthetic can we hope to escape from the present unscientific position in which the choice of anaesthetic must often be largely a matter of personal bias on the part of operator or anaesthetist" In goitre operations for which avertin has been increasingly employed, there should already be material for instituting a comparison between this and alternative drugs With the object of obtaining such comparable figures I have for some time been employing avertin as the routine procedure in my gynaecological department in Edinburgh, with results that now seem to justify some tentative conclusions Up to date we have 743 successive and unselected operations with four deaths a mortality of just over 0·5 per cent Our previous mortality in 1,799 successive cases with ether alone or combined with chloroform as the routine anaesthesia was 34, or 1·9 per cent, which accords generally with the published experience of other gynaecological clinics Thus the Royal Samaritan Hospital for Women Glasgow during 1928 had a mortality of 31 in 1,836 operations—that is, 1·7 per cent—and during 1929 a mortality of 34 in 2,598 operations or 1·3 per cent Dannreuther[2] in New York had 19 deaths in

[1] *Lancet* May 31st 1930 p 1177
[2] *Medical and Clinical Reports* 1928 and 1929
[3] *Surg Gynecol and Obstet* October 1930 II, 522

1,000 successive operations—that is, a mortality of 1 9 per cent

In this place I cannot give the complete data, and must be content with stating that we are coming to conclude that the use of avertin as the "basal anæsthetic," combined with ether in reduced quantity as a supplemental anæsthetic, has contributed to the lowering of our mortality

(*a*) By *the reduction of post operative pulmonary complications* In 743 operations there were three instances of bronchitis or broncho pneumonia with one death after an operation for prolapse in a woman with toxic goitre and debility This is the only case in which death occurred after an operation other than an emergency procedure involving a "life or death" decision Dannreuther, in 1,000 cases, records seventeen post-operative pulmonary complications with four deaths As I have stated, we employ ether in practically all cases, and it is our impression that a main factor in the reduction of these complications is that with avertin there is an almost complete absence of vomiting during or immediately after the operation, and a consequently decreased risk of inhalation of septic matter In this connexion Dannreuther states that 'eight of the twelve pneumonias developed in ward patients to whom anæsthetics were administered by less experienced anæsthetists' Our experience leads us to the view that such contingent risks are reducible with the avertin ether procedure

(*b*) By *the reduction of post operative gastro-intestinal complications* There have been no cases of acute dilatation of the stomach, paralytic ileus, etc

(*c*) By *the reduction of post operative sepsis* This we believe to be related to the absence of post operative sickness and the trauma of straining, a factor of supreme importance in abdominal surgery, and in plastic operations on the pelvic floor To the above mentioned considerations must be added the great advantages which, in comparison with ordinary inhalation methods, avertin possesses in the ease and comfort which it brings, both to the induction of the anæsthesia, and the post operative sensations of the patient

Finally, I should state that we employ the drug in a ratio of 0 1 gram per kilo of body weight, preceded by a preliminary hypodermic injection of 1/8 grain of a morphine salt —I am, etc,

Edinburgh Dec. 1st. JAMES YOUNG

SIR,—In your issue of November 22nd Mr Basil Hughes states that, so far as he knows, the properties of avertin as a general anæsthetic, especially for routine work, were never claimed This suggests that Mr Hughes is unacquainted with the German literature If he will refer to this literature he will find several papers in which it is stated that it was used as a general anæsthetic in unselected cases—for example, Haas (*Deut med Woch*, 1927, liii, 1375) describes a hundred cases, which he divides into four groups In 23 per cent a good effect was obtained by avertin alone, in 29 per cent avertin alone is said to be satisfactory, in 42 per cent ether was required late in the operation, and in only 6 per cent was it necessary to use ether at the commencement of the operation The makers of tribromethyl alcohol state, in an advertisement of October, 1930 "Avertin fluid—the anæsthetic for rectal administration"

Mr Hughes also writes, referring to avertin, that "by its use other drugs necessary to complete anæsthesia can be used in amnesic dosage, which avoids their inevitable toxic effects following major operations in which they are used alone" This kind of unprecise language I find a little difficulty in dealing with, because I do not know what an amnesic dose of chloroform or ether may be, though it might be easy to enunciate it for hyoscine, also, the "inevitable toxic effect" of, for example, ether, must be compared with the variable effect, the lack of control, the respiratory depression, the possibility of liver and kidney damage, and the delayed excretion, all or any of which may be features of avertin anæsthesia Chloral hydrate per rectum was once much in vogue as an anæsthetic for children, especially in France, paraldehyde and many other narcotic substances have also been used, and, as I write this, a long article is before me in which the writer advocates ordinary ethyl alcohol, not the tribrom variety, for producing general anæsthesia

In conclusion, I venture to believe that no valid evidence has been produced to alter the opinions expressed in my original paper, and I am given to understand that confirmatory evidence of these may be shortly forthcoming both from Germany and from America —I am, etc,

Cambridge, Nov 27th F B PARSONS

SODIUM AMYTAL

SIR,—I have just finished reading the two very interesting articles on sodium amytal in the *Journal* of November 29th (p 897) I wish to report the following case of respiratory failure after using the drug

A woman, aged 55 years, apparently of satisfactory health and of good medical history, was admitted to the Dreadnought Hospital, Greenwich, under the care of Mr Percival P Cole She was operated on for severe pains in the abdomen, chiefly situated in the right iliac region A laparotomy was performed The appendix, which was bound down and inflamed was removed, and numerous adhesions in the cœcal and hepatic regions were severed Other parts of the abdomen were explored, but nothing unusual was found The anæsthetic given was 1 gram of sodium amytal, under strict aseptic precautions, together with nitrous oxide and oxygen supplemented by a little ether in order to get sufficient abdominal relaxation The quantity of gas and oxygen given was small as compared with a case which had not had sodium amytal as also was the amount of ether The time taken for the injection was nine and a half minutes The patient behaved perfectly until she was about to be returned to the ward after the operation It was then noticed that she was becoming cyanosed, and that her respirations had practically ceased The gas and oxygen had been stopped as soon as the peritoneum had been closed At that time the pulse was good, blood pressure normal pupils normal in size, and the respirations inclined to be shallow

At the moment of respiratory failure artificial respiration was administered, oxygen being given at the same time The breathing returned, but stopped as soon as this was discontinued This was repeated several times, and the same thing happened It was then decided to pass an endotracheal catheter, and attach it to the gas and oxygen apparatus Oxygen with 5 per cent carbon dioxide was then given in this way, which at once restored the respirations It was due to this treatment that the patient was kept alive for the next eight hours The pulse rate was good, in both volume and rate, the blood pressure a little below normal The pupils were widely dilated, and had a definite lustre Cardiac stimulants were given on the operating table, adrenaline 10 mm and coramine 1 c cm Thyroxine 1 c cm was given two hourly in order to stimulate the basal metabolism and thus help to get rid of the drug a little more quickly but this had to be stopped after the fourth injection, as it was affecting the pulse rate At the end of six hours atropine, 1/100 gram, was given hourly, as the chest showed signs of becoming congested, later on it was given four hourly, until she showed definite signs of returning consciousness

At the end of eight hours the pulse first showed signs of becoming weak At this stage normal salines were given per rectum hourly black coffee being substituted for the saline at intervals During this treatment her condition so improved that the catheter was removed, and it was found that the oxygen and the carbon dioxide could be discarded altogether Her corneal reflex had returned, and she had started to groan a little at the same time making slight movements with her face To try and establish the improvement 300 c cm of normal saline were given intravenously, and from this time she never looked back At the end of sixteen hours she spoke for the first time, and then settled down again The salines were then discontinued A few hours later she became so restless that she was given 1 c cm of omnopon in order to make her sleep again, which she did for the next few hours. On returning to consciousness she knew nothing of her conduct and could not understand the pain in her abdomen She ran a temperature for the next few days, which in time settled down and an uneventful recovery ensued, the patient never knowing how ill she had been

This case is of interest, as in all probability the patient would have died if it had not been for the passage of the endotracheal catheter and the administration of oxygen and carbon dioxide It was by this means alone that her respirations were controlled The salines and the black coffee, all of which she retained, stimulated her after the catheter was removed, and thus gradually restored her to full consciousness I wish to thank Mr Cole for giving me permission to report the case —I am, etc,

London, W 1, Dec. 2nd RONALD JARMAN

DIATHERMY EXCISION OF TONSILS

SIR,—It is an ancient but discredited method in controversy to wrench from writings such items as suit us, and to leave those that militate against us discreetly alone. This is what Dr. Warner Collins has done in his letter disagreeing with my warning about too extensive diathermy coagulation of the tonsil at one sitting. May I suggest to him that he turn once more to my book on *Diathermy* and read the sections dealing with this subject in their entirety, dwelling particularly upon page 66, line 1 et seq., and pages 74 and 75?—I am, etc.,

London, W.1, Dec. 6th. DAN MCKENZIE.

MIGRAINE

SIR,—As one who has studied migraine (hemicrania) for many years, may I remark on the discussion on the treatment of headache which took place at the November meeting of the Chelsea Clinical Society (*British Medical Journal*, November 29th, p. 907)? Doubtless this was an informal discussion" but I was a little surprised to find no reference in the report to the *periodicity* of hemicrania. This weekly, fortnightly, monthly, or other rhythm of the headache is one of the most characteristic things about it.

Dr. Feiling said that "a line of treatment was now being pursued on the hypothesis that the condition was due to some liver deficiency." This interested me, because I contributed a letter to the *British Medical Journal* of February 5th, 1927, in which was a tentative theory of the production of periodic hemicrania, a portion of which I should like to quote:

"Let it be granted that a toxæmia is the underlying condition (of which personally I have not the slightest doubt) and that the liver is the great organ of detoxication. The liver is constantly destroying poisons more or less perfectly in different persons; in some it detoxicates so perfectly that the poison never accumulates and they therefore never have headache. In certain less fortunate persons the liver traps the poisons less perfectly, so that some are always escaping over into the circulation. When the toxin accumulates beyond a certain concentration in the blood the syndrome of hemicrania is established. The exact period of this toxic situation may be one of seven days or fourteen or thirty or forty-two, giving the weekly, fortnightly, monthly, or six-weekly headache as the case may be. In other words, the rhythm of the headache is dependent upon a pre-existing rhythm in the detoxicating capabilities of the liver."

I noted with satisfaction that there was no serious advocacy of the view that the chief factor in hemicrania is of a psychic nature.—I am, etc.,

Chiswick, W.4, Nov. 29th. D. F. FRASER HARRIS.

A SUGGESTED HORMONIC CAUSE FOR CYSTIC CONDITION OF THE OVARY

SIR,—The subject of the interaction of the ovary and the anterior lobe of the pituitary body is very interesting from a physiological point of view. It seems to me moreover that such interaction might possibly be the basic cause of cystic condition of the ovary.

The anterior pituitary lobe has been described as the 'motor of the ovary.' It produces two hormones, one of which stimulates ovulation and maturation of the follicle with the production of the follicular hormone. This last hormone has as one of its actions cornification of the cells of the vagina. The second pituitary hormone acts on the Graafian follicle and 'luteinizes" that structure, with the production of the luteal hormone, which in its turn represses any further ovulation during the latter half of the twenty-eight-day cycle. In association with the follicular hormone, the luteal hormone causes progestational development of the endometrium. It appears that the corpus luteum thus formed can only be destroyed by these hormones if they are in concentration.

The interesting point to me is as follows. If the anterior lobe of the pituitary body is *capable of effecting this* physiologically, it seems that it may 'run riot," and that the cornification and luteinizing effects may proceed to the pathological cystic condition. On the other hand, there appears to be a therapeutic agent available, which might be employed in the idiopathic uterine haemorrhage of young women since if a persistent corpus luteum should result from the use of this agent, uterine haemorrhages would cease. Even so, there would still be the risk of the occurrence of a cystic ovary, possibly at the menopause.—I am, etc.,

JOHN N. MCINTOSH, M.B. Ed.

Port Royal, Jamaica, Nov. 18th.

PHLEBITIS AND EMBOLISM

SIR,—I am interested in Dr. Jeudwine's letter in the *Journal* of November 29th (p. 933), and am writing for further information.

I understand that a primary embolism may occur in the lung without any thrombus in the veins of the leg; but what proof is there that, in a case of phlebitis in the leg followed by pulmonary embolism, the latter is an independent deposit, and not a clot carried up from the leg? I admit the strange immunity of those who, after suffering for days with phlebitis, have walked into my surgery to be hurriedly forced into bed, where recurrent deposits of thrombosis have occurred in their leg. The unhappy recollections of pulmonary thrombosis following operations for a cold appendix or a clean hernia make one think twice before advising the ambulatory treatment for *phlebitis*.—*I am*, etc.,

Acton, Nov. 30th. J. T. S. GIBSON.

CANCER OF THE TONGUE

SIR,—In my article on cancer of the tongue appearing in the *British Medical Journal* for November 8th, I credited Stevenson of Dublin with being the first to employ the principle of interstitial implantation of radium. I have since been informed that while Stevenson made the first interstitial applications with radium in hollow needles he was not the first to employ the principle of interstitial irradiation. I am informed that Finzi and others inserted *tubes of radium in the tumour-bearing* areas as early as 1909, and it is believed that this method was probably first employed by Dominici. I offer my apologies for this error.—I am, etc.,

New York, Nov. 22nd. DOUGLAS QUICK.

NOCTURNAL INCONTINENCE IN CHILDREN

SIR,—My attention has been drawn to Dr. Pereira Gray's memorandum in the *Journal* of November 29th on the subject of nocturnal incontinence in children. I wish to endorse the remarks made on the futility of most recognized remedies for this distressing complaint, whether by the administration of belladonna, by circumcision, reduction of the acid reaction of the urine, removal of tonsils and adenoids, abstention from liquids after 5 p.m., lying on hard boards, or waking the patient at stated intervals. There may be case of bladder irritability due to threadworms, for instance, but these are rare. Excluding the existence of organic nervous diseases, the bulk of cases fall into two groups. The first includes children who have never been properly educated in bladder control, which is usually established at two and a half years of age. Some authorities consider bed-wetting to be a reversion to infantile habits because of its frequency in 'over-mothered" children. The second group includes the type which gives the greatest difficulty in treatment. Such children are usually nervous and excitable; they are often worried about school lessons or they may be jealous of a new arrival in the family circle. Disorders of sleep such as restlessness, bed-wetting, talking or even walking in sleep are sequels and are due to an over-active subconscious mind. One of the best ways of calming the subconscious is by mental suggestion and auto-suggestion, which can be practised without any elaborate technique. It is important, however, to find the cause and to remove it; otherwise it may be found that although the bed-wetting is cured it may be replaced by *some other abnormal* trait.

I have cured many cases of nocturnal enuresis within a few weeks of commencing this treatment. The method is as follows. It is essential first of all to obtain the confidence of both parent and child, and to explain to the

former that punishment and even reproof should be withheld from the child, but also that the bed-time routine should be unfailingly the same. The mother should, during sleep, and is not done with the intention of punishing the child, and with suitable emphasis say "Now, John, you're going to have a dry bed to-night" (or "dry night", that on which the appropriate space is left, when the child fails to have a dry bed

engaged in promoting the teaching of pathology in Oxford So too, his intimacy with Professor Drever who was at that time working at Oxford gave a bias to his inclination towards the scientific side with the result that he made this field of research the dominant influence in his early career He soon made for himself the reputation of being one of the younger men marked out for distinction in this particular branch of study Considerations of another kind, however, arose which compelled the transference of his activities and responsibilities in other directions, and so his promising scientific career was cut short, though, as I know, his interests in medicine were paramount till the day of his death

The one incident in his life which has endeared his memory to all of us in Oxford who are concerned with the interests of the medical school is the fact that it is to his bounteous generosity that we owe the erection of the first pathological department in 1901 While still an undergraduate he handed over to me a cheque for £5,000, to use as a lever to enable us to stimulate the University, at that time sadly in need of funds to provide for the necessities of our growing medical school In those days there were many who were opposed in one way or another to the development of such a school Experience had taught us that the antivivisectionists were active but happily by the practice of judicious methods, the opposition was disarmed The University found ways and means to supplement Frazer's benefaction, with the result that pathology was equipped with a laboratory worthy of Oxford Therein Ritchie, then appointed professor, continued his teaching until he became professor of bacteriology in Edinburgh Thereafter Professor Drever, his successor worked there until recent times, when through the benefaction of the Sir William Dunn Trustees he was enabled to avail himself of the larger and more commodious department, opened in 1927, the original pathological buildings being taken over by the professor of pharmacology Dr Cunn

Frazer's gift proved invaluable at a very critical period in the history of the school, for without his generous aid our progress might have been long delayed We owe much of our success to the generous impulse of an undergraduate who recognized so clearly what the pressing needs of the school were

Of Frazer himself little need be said He was of the type that does not make friends readily, but after the barriers of mere acquaintance had been broken down his friendship proved itself to be loyal, steadfast, and generous He was a man of action rather than words He took a broad view of things, and his interests were wide Very sympathetic, he was ever helpful to those in need, and his hand was as generous as his heart His latter years were clouded by the death of his eldest son, who was killed before his eyes by an accident in the Alps The lad had a brilliant career before him and the stricken parents endowed a scholarship at Balliol in his memory Dr Frazer leaves a widow and two children

---

DR RALPH WILLIAM WILSON who died in a London nursing home on November 21st, was born at Holy Island Northumberland in 1853 He graduated M B C M at Edinburgh in 1877 and proceeded M D ten years later He came of seafaring stock, and one of his first appointments after graduation was that of medical attendant to a nobleman on a voyage round the world For some time he assisted the late Sir William Gowers, and, indeed, whilst abroad on another voyage was recommended by him for a court appointment Dr Wilson began practice as an assistant in Surbiton, but after several years there his friend Sir W Thiselton Dyer director of Kew Gardens, persuaded him to transfer to Kew, where he remained in practice for forty years It was a source of great delight to him that he had so much scope in the Gardens for his botanical researches He was a Justice of the Peace, and was twice president of the Richmond Athenaeum His connexion with the British Medical Association went back to the days of the old Richmond Division He resigned in 1913 because of his disagreement with the terms of the National Health Insurance Act, but he was very enthusiastic over the new Richmond Division, and spoke at the inaugural meeting last January in favour of forming a Division of great strength Unfortunately, illness prevented his attendance at any further meetings The loss of his keen intellect and long experience is a severe one to the district in which he resided He was buried at Holy Island on November 26th, and a memorial service was held at St Luke's Church Kew Gardens, which was attended by a large congregation, consisting of his medical colleagues in Kew, his old patients, and numerous friends

---

Universities and Colleges

UNIVERSITY OF OXFORD

DR FREDERICK AUGUSTUS DIXEY Emeritus Fellow of Wadham has been elected to an honorary Fellowship in the College

UNIVERSITY OF CAMBRIDGE

THE Raymond Horton Smith prize for the best M D thesis submitted during the academic year 1929–30 has been awarded to P M D A Hart M A M B of Gonville and Caius College

Dr L G Holmes (Christ's) has been elected Fellow and tutor of Downing the latter appointment to take effect from March 25th 1931

At a congregation held on December 5th the following medical degrees were conferred

M D—W H Crab

M B B Chir.—R W L. May A R Banham R. M. Bolam S McDonald.

UNIVERSITY OF BRISTOL.

UNIVERSITY OF LIVERPOOL

DR H E ANNETT has been appointed to the Samuel Turner Research Fellowship for three years from January 1st, 1931

NATIONAL UNIVERSITY OF IRELAND

AT a meeting of the Senate held on December 4th Dr Denis J Coffey President of University College Dublin was elected Vice Chancellor of the University from January 1st 1931 to December 31st 1932. The degree of M D was awarded to Professor F N McDermott A report from Dr Coffey as representative of the University on the November session 1930 of the General Medical Council was considered Professor J O Saunders University College Cork was appointed to represent the University at the Royal Sanitary Institute Congress at Glasgow in 1931. Dr James R. Hackett was reappointed lecturer in dental surgery at University College Cork

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH.

AT the annual meeting of the College held on December 4th, Sir Norman Walker who presided was re-elected President for the ensuing year Drs Robert A Fleming Robert Thin Wm Fordyce Edwin Bramwell Edwin Matthew and A. Fergus Hewat were elected members of Council and Dr Robert Thin was nominated Vice-President

At an extraordinary meeting held at the close of the annual meeting Drs John Orr and William Fordyce were elected representatives on the Board of Management of the Royal Infirmary

The College voted a sum of 1 000 guineas to the Royal Infirmary Edinburgh in response to its Bicentenary Appeal

ROYAL COLLEGE OF PHYSICIANS OF IRELAND

AT the monthly business meeting on December 5 h Dr Victor M. Synge was appointed Profes or of Medicine in the schools of surgery of the Royal College of Surgeons in Ireland It was decided to appoint from among the Fellows voluntary delegates to the Congresses of the Royal Sanitary Institute and of the Royal Institute of Public Health to be held in 1931. The representative of the College reported on the proceedings of the recent session of the General Medical Council

Medical Notes in Parliament.

[FROM OUR PARLIAMENTARY CORRESPONDENT]

THE House of Commons this week read the Unemployment Insurance Bill a second time and passed it through committee The third reading was down for December 11th The committee stage of the Education (School Attendance) Bill was continued on December 10th On December 12th the first order was the Slaughter of Animals Bill

On December 4th the Expiring Laws Continuance Bill passed through committee A proposal to continue the Dyestuffs Act was defeated During the debate Mr Henry Mond remarked upon the importance of the dyestuffs industry to every form of research into organic chemistry He contended that a great *school of workers was needed* for this research not merely a few people in laboratories and such a school could only be built upon a well established and sound organic chemical industry Lister began with the study of phenol and created the science of antiseptics, but phenol was simply another grouping of carbon atoms Metchnikoff discovered the enzyme which was based on carbon Only by intense and wide study of organic chemistry were they likely to gain more knowledge of the enzyme Salvarsan was based on carbon So was the chemistry of the hormone and the chemistry of vitamins, as had been shown by Professor Starling and Sir Frederick Gowland Hopkins A great school of English chemists had been built on the organic side but far more remained to be done and would not be done unless there was a real opportunity for men to go from the university into industry to continue their study of organic chemistry

Conferences are expected at the Ministry of Health within the next ten days over the text of the Pharmacy Bill, which has lately been examined by professional organizations in the country The Government has not yet promised to introduce the bill, which in any event is unlikely to be brought before Parliament till the New Year

At the House of Commons, on December 3rd, a subcommittee of the Socialist Medical Association was formed to prepare a scheme for medical services during the "period of transition to a State service" Dr Salter, Mr Somerville Hastings, and Dr Forgan were added to this committee

Sir Charles Trevelyan announced on December 8th, that Dr Salter would be a member of a departmental committee to survey the present position of schools not in receipt of grants from public funds

On December 8th Mr Ramsbotham raised a case under the Asylum Officers Superannuation Act, 1909 In reply, Miss Susan Lawrence said the policy of the Government was to place the Act on a better actuarial basis For some months actuaries had been making preliminary inquiries which she hoped would result in better superannuation schemes

Hospitals

On December 3rd replying to Mr Winterton, Mr MACDONALD said that it did not seem to be necessary at present to appoint either a Royal Commission or a Select Committee to inquire into the advisability of making hospital treatment a State service Local authorities had powers under the Public Health Act, both to provide hospitals and to contribute to voluntary hospitals

In reply to Mr Gardner on December 3rd, Mr GREENWOOD said that in 1928 29 local authorities were providing for 166 hospitals for tuberculosis with 12,804 beds, at a cost of £1,165,000, 987 hospitals for acute infectious diseases, with 987 beds, at a cost of £3 620 000 and 80 maternity hospitals and 9 babies hospitals with 1 040 and 233 beds respectively, at a cost of £268 000 In addition local authorities had aided 139 tuberculosis hospitals with 9 298 beds and 166 general hospitals with tuberculosis schemes at a cost of £621,000 26 maternity sections, with 279 beds 64 maternity hospitals with 1,336 beds, and 14 babies hospitals with 347 beds at a cost of £114,000, and had also assisted venereal diseases schemes in 130 hospitals One large general hospital with 875 beds, and three relatively small accident hospitals were provided by local authorities at March 31st last Since that date 17 hospitals with approximately 12 500 beds which were provided under the Poor Law Acts had been appropriated as general hospitals under the Public Health Acts also three Poor Law institutions or infirmaries had been partly appropriated as general hospitals Subscriptions or donations made by local authorities in pursuance of Section 64 of the Public Health Act 1925 amounted in 1928-29 to £30,000 Contributions made by boards of guardians to public hospitals, with the consent of the Minister of Health, in pursuance of Section 38 of the Poor Law Act, 1927, amounted in 1928-29 to £38,000 Institutions formerly provided by Poor Law authorities numbered 73 wholly for the sick, exclusive of mental cases with 40,000 beds, at a cost in 1928-29 of £4,316,000, and 652 general institutions (with a total accommodation of some 188 000) with 83,000 beds in infirm and sick wards, and at a cost of £8,880 000 in 1928-29

Medical Certification and Pension Tribunals

Mr AITCHISON, on December 8th, replying to Mr Wardlaw Milne, said that appellants in pension cases might be and frequently were accompanied by their medical advisers at the hearing of their appeals In almost every case the appellant brought a certificate from his medical adviser which was carefully considered before the tribunal gave its decision In cases where the appellant failed to bring a certificate or the certificate was not sufficiently comprehensive, it was the usual practice of the tribunals to adjourn the hearing until the information required was obtained from the medical adviser either by the appellant or, with the consent of the appellant by the tribunal

Opium

Mr SHORT, replying to Mr Campbell on December 8th, said that the function of the Opium Advisory Committee of the League of Nations was to assist and advise the council of the League in dealing with traffic in opium and other dangerous drugs

Small pox and Vaccination

Mr GREENWOOD informed Mr Groves, on December 9th that he had no specific evidence that the incidence in any area of the type of small pox at present prevalent in this country bore any close relation to the percentage of infants vaccinated in that area The incidence of the disease was, however almost entirely limited to unvaccinated persons or persons who had not been successfully vaccinated within recent years

Vaccination and Encephalitis

On December 9th Mr GREENWOOD told Mr Groves that 14 cases in which symptoms suggestive of disease of the central nervous system followed within a month of vaccination had been brought to the notice of his Department as having occurred during the twelve months ended September 30th, 1930 He was advised that 8 of these cases, 4 of which proved fatal, might be regarded as cases of post vaccinal encephalitis Of these 8 cases 7 were vaccinated with Government lymph, and in 1 case there was no information as to the lymph used

Veterinary Education—Dr ADDISON told Major Carver on November 27th that, besides the Royal Veterinary College Liverpool University, the Royal (Dick) Veterinary College Edinburgh and the Glasgow Veterinary College provided veterinary education In addition, the University Department of Animal Pathology at Cambridge, the Ministry of Agriculture's Veterinary Laboratory at Weybridge, and the station of the Scottish Animal Diseases Research Association near Edinburgh existed for the purpose of research in animal diseases He said he was fully aware of the financial position of the Royal Veterinary College, and the Government had offered on certain conditions a grant of £150,000 towards a scheme of reconstruction costing £250 000 and were further prepared to contemplate an increase of the present maintenance grant when the reconstruction was completed He trusted that, with the help which the College might be able to obtain from other sources, these grants would be sufficient to avert the closing down of the College which would be deplored

Awards of Pensions—Mr ROBERTS on December 2nd, informed Major Carver that during the twelve months ending last September, *some 26,300 final pension awards were made* The number of officers and men medically re-examined at the instance of the Ministry of Pensions had been greatly reduced and at the present time was *not more than about 300 a week* There was no power, nor would it be in the best interests of pensioners to make final awards in all cases without regard to whether they were suitable or not, but the policy of the Department was to give prolonged awards wherever justifiable

Mentally Defective Children—Replying to Mr Day on December 3rd, Sir C TREVELYAN said that there were according to the latest returns, 32,775 educable mentally defective children ascertained by local education authorities in England and Wales Of these, 28,598 were attending schools or other institutions He was unable to give figures for uneducable children on a comparable basis, but was informed that the name of 3 971 children were notified to local authorities under the Mental Deficiency Acts during the year 1929, of whom 352 were sent to institutions On December 9th Mr JOHNSTON told Mr Tran that the number of educable mentally defective children between 5 and 16 receiving instruction in special school classes and residential institutions in Scotland was 3 939 He could not state the precise number of the classes but the number of children in a class was limited to twenty The statistical information available did not enable him to separate the expenditure on such instruction

The Services

HONORARY SURGEON TO THE KING

SURGEON CAPTAIN R J WILLIAMS M V O O B E R N V R, has been appointed honorary surgeon to the King in succession to the late Surgeon Captain A R Brailey, R N V R, from December 1st.

DEATHS IN THE SERVICES

Lieut Colonel George Elliott Cathcart O B E R A M C died in London on September 10th aged 53 He was born on March 5th 1877 the son of the late Major H D Cathcart was educated at Bart s and took the M R C S and L R C P Lond in 1901 After serving as a civil surgeon in the R A M C for nearly a year he entered that corp as a lieutenant on January 30 h 1904 became major on July 1st, 1915 and lieutenant-colonel on September 15th 1926 He served in the war of 1914-18 was mentioned in dispatches in the *London Ga ette* of July 4th, 1916 and March 12th, 1918, and received the O B E.

Lieutenant John Anthony Timoney R A M C, died in Egypt on September 8th He was educated in the National University of Ireland graduating as M B, B Ch and B A O in 1927, and entered the R A M C as lieutenant on October 26th 1928.

Medical News.

THE Sections of Electro-therapeutics and Comparative Medicine of the Royal Society of Medicine will hold a joint discussion on radiological problems in man and animals, on Friday December 19th, at 8.30 p m

A MEETING of the Royal Microscopical Society will be held in the Hastings Hall British Medical Association House Tavistock Square W C on Wednesday, December 17th at 5 30 p m Mr S C Akehurst and Mr J M Preston will read papers At the annual general meeting of the society on January 21st 1931 Professor R Ruggles Gates will deliver his presidential address

A COURSE of twelve lectures on "The Life of the Past" is being given by Dr T M Finlay in the Lecture Theatre of the Imperial College of Science (Royal College of Science, Old Building), Exhibition Road, South Kensington The course opened on December 8th and the remaining lectures will be delivered on December 15th, 17th and 19th, and on January 5th 7th, 9 h, 12th, 14th and 16th, at 5 30 p m Admission is free

A THREE months course of lectures and demonstrations on clinical practice and in hospital administration will be given at the North Eastern Hospital Tottenham, by the medical superintendent Dr F H Thomson, on Mondays and Wednesdays at 4 45 p m and alternate Saturdays at 11 a m, commencing on Monday January 5th, 1931 The fee for the course which complies with the requirements of the revised regulations of the General Medical Council, is £4 4s A course may however, be taken under the old regulations at £3 3s Practitioners desiring to attend the course of instruction are required, before attending the hospital to pay the requisite fee to the medical officer of health London County Council, Public Health Department (Special Hospitals), Victoria Embankment E C 4, giving their full name and address

PARTICULARS of the lectures and demonstrations arranged for next week by the Fellowship of Medicine will be found in our Diary of Post graduate Courses, published in the *Supplement* at page 260 Copies of syllabuses and tickets of admission can be obtained from the Fellowship 1 Wimpole Street W 1 The list of special courses arranged for 1931 is now available

ON December 4th the autumn dinner of the Irish Medical Schools and Graduates Association was held at the Piccadilly Hotel, with the president *Dr W P Kennedy in the chair* After the usual loyal and patriotic toasts had been honoured Dr J Howard Humphris in proposing the health of the guests said that they wished to offer them a whole hearted welcome—indeed all that was meant by the term Irish hospitality " Speaking especially of the guest of the evening Sir Frederick O Connor Dr Humphris said that he was soldier diplomat explorer and even film star and wherever he had been he had always upheld the tradition of his native country Sir Frederick O Connor said that although he was a gunner he had had much experience of doctors and he admired the profession of medicine for its universality and its humanity He gave instances of two occasions in Tibet and in Persia when the prestige of the British nation had been unmistakably established in a hostile atmosphere by the good work and sympathetic attitude of his medical officers In reply to Dr William Doolin, who proposed the toast of ' The President and Association ' with enviable brilliancy and wit, Dr W P Kennedy said that the association stood for unity and guidance of Irish doctors who settling in England might have initial difficulties in their new environment, he urged all new graduates to get in touch with it as soon as they reached England Helped by the friendship and experience of more sophisticated exiles, they were assured that their problems would meet with a speedy solution An enjoyable programme of music was provided by Miss Alice Lilley Miss Kathleen O Hagen and Mr Ernest Bertram, whose songs brought the air and the verdure and the romance of the green isle very near to their audience Later in the evening two of the guests further entertained the company with songs and stories, after which the company went downstairs to ' chase the glowing hours with flying feet "

IN and after 1930 one or more scholarships of the value of £300 a year for five years may be awarded annually by the Government to suitable candidates of African birth for the purpose of studying medicine in the United Kingdom The candidate must undertake to return to practise in British West Africa immediately on the successful completion of his studies but he may be allowed to postpone his return at his own expense for a maximum period of three years in order to acquire additional professional qualifications, and on the expiration of the permitted period he will be granted a first class passage to British West Africa

WITH the approval of the chairman of the London County Council, Mr R L Guthrie coroner for the eastern district has appointed Dr Percy Bernard Skeels, solicitor Mr W B Purchase coroner for the northern district has appointed Mr Francis Danford Thomas barrister at law, and Mr S I Oddie, coroner for the central district has appointed Dr Francis Temple Grey, barrister at law, to act as their respective deputies

IN response to its appeal, first launched five years ago the Middlesex Hospital has received £374 000 A further sum of £249 000 will be required to complete the enlarged scheme of rebuilding

THE Leprosy Commission set up by the League of Nations will work in close contact with the Congress of the Association for Tropical Medicine in the Far East which is now meeting also at Bangkok At this session the Commission will endeavour to lay down the principles for combating leprosy just as the Malaria Commission did for malaria It is hoped that it may be possible to evolve certain principles of action in harmony with the experience of clinicians, hygienists and laboratory workers The work of the Commission has been prepared by its secretary Dr Burnet, who in the course of visits to leper colonies and interviews with leprologists in London, the Scandinavian and Baltic countries, France the Mediterranean countries, the South American Republics India the Malay States the Philippines, and China, has noted a series of observations

THE annual report of Livingstone College for the year 1929-30 contains fresh evidence as to the value of the educational work which is being carried on in that institution More than 1,100 missionaries have received training there and some return later for further study An appeal is being made for £800 to replace worn out equipment, and to renovate the structure of the house The full session, from October to June comprises three terms, those who are unable to undertake this can be admitted for a six months or a three months course An intensive course, consisting of lectures on the care of health in the Tropics is given three times a year—in March September and December—lasting three days These lectures are open to any who are expecting to work in tropical countries Further particulars may be obtained from the principal, Dr Tom Jays, Livingstone College Leyton E.10

THE centenary of the birth of Jules Émile Péan the celebrated surgeon to the Hôpital St Louis Paris who died in 1898 was celebrated at the Académie de Médecine on November 25th when his eulogium was pronounced by Dr Jean Louis Faure, professor of clinical gynaecology in the Paris faculty

PROFESSOR HANS FISCHER of Munich has been awarded the Nobel prize for chemistry

THE title of doctor *honoris causa* has recently been conferred by the University of Liège, on Professor Calmette of the Institut Pasteur and on Dr Louis Lapicque, professor of physiology at the Sorbonne

THE centenary of the foundation by Lucas Championnière of the *Journal de Médecine et de Chirurgie Pratiques* was recently celebrated in Paris.

Letters, Notes, and Answers.

All communications in regard to editorial business should be addressed to **The EDITOR, British Medical Journal, British Medical Association House, Tavistock Square, W C 1**

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated Correspondents who wish notice to be taken of their communications should authenticate them with their names, not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W C 1, on receipt of proofs

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal*, should be addressed to the Financial Secretary and Business Manager

The **TELEPHONE NUMBERS** of the British Medical Association and the *British Medical Journal* are *MUSEUM 9561, 9562, 9563,* and *9564* (internal exchange, four lines)

The **TELEGRAPHIC ADDRESSES** are

EDITOR OF THE *BRITISH MEDICAL JOURNAL*, *Aitiology Westcent, London*

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements, etc), *Articulate Westcent London*

MEDICAL SECRETARY, *Mediocrity Westcent, London*

The address of the Irish Office of the British Medical Association is 16, South Frederick Street, Dublin (telegrams *Bacillus, Dublin* telephone 62550 Dublin), and of the Scottish Office 7, Drumsheugh Gardens, Edinburgh (telegrams *Associate, Edinburgh*, telephone 24361 Edinburgh)

QUERIES AND ANSWERS

Keeping Fit in Hot Climates

LIEUT COLONEL F W W DAWSON (M O H, Christchurch, New Zealand), replying to the inquiry of C H B in the *Journal* of July 26th (p 168), denies that total abstainers are the first to go sick in a hot climate He states that in 1901-2, while doing hospital duty at Kroonstand, where there were many enteric cases, four of his colleagues died from enteric fever within four months Neither then, nor when he was again in South Africa from 1904 to to 1908, was he off duty for illness, though he has been a lifelong abstainer He adds that he has also served continuously for eight and a half years in India, Burma, and Mesopotamia, and for one year in Sierra Leone He has never had malaria, dysentery, or enteric fever, though he had one week off duty in India with dengue fever He writes A small quantity of alcohol is pleasant to those who are accustomed to it, but it should never be taken before sunset It appears to relieve the alleged monotony of tropical life, and to improve the outlook on things in general Any excess of alcohol, however slight, and particularly if not very well diluted, is definitely prejudicial to health in a warm climate It increases the tendency to infection and definitely lowers the resistance of the body to these diseases when infection has taken place Alcohol is a predisposing factor in heat-stroke While it is possible for an abstainer to get sun stroke through carelessness in the use of a helmet I have never heard of an abstainer suffering from heat stroke The suggested covering of the lower abdomen is sound, but difficult to put in practice, since most persons throw off the covering in their sleep I never found it necessary to take violent exercise I played golf, a few sets of tennis, and took light boating exercise or swimming when I felt I would enjoy it, but I certainly never made a fetish of exercise

Income Tax

Honorary Appointment and Expenses Research Studentship

"C C was, until November 16th, acting as unpaid house physician, on October 1st he was appointed a demonstrator of pathology at £300 per annum and was awarded a research studentship of £275 per annum He asks for information on various points, as indicated in the following reply

*** Studentships are not exempt from tax unless they are 'held by a person receiving full time instruction at a university, college, school, or other educational establishment"—Section 28, Finance Act 1920 The studentship in question does not apparently fall within the exempted class If research on any defined lines is a condition of holding the studentship, the expense of supplying the necessary materials, etc, would be deductible for purposes of the assessment The expense of running a car would be allowable only if necessarily incurred in carrying out the duties of the office—not, for example, incurred in going to the place where the duties are carried out The cost of furnishing and equipping a consulting room would be capital outlay, but the rent and similar annual expenses would be deductible from the amount of the consultation fees earned If there was no assessable income from the appointment as house physician the payments to a locumtenent for doing that work are not allowable The expenditure on medical journals and societies can be deducted if the appointments are held on the condition (expressed or implied) that that expenditure shall be incurred

Car Obsolescence Allowance

"M D, D P H" has used his car partly for private and partly for professional purposes He had one allowance only—that is for 1930-31 of £8 10s, being one half of the full allowance of 15 per cent on £110, the then written down value of the car He has now sold the car for £66 and bought another for £140 What should he claim for 1931-32

*** If the car were entirely used for professional work the allowance would be as follows

		£
Original cost		150
Deduct wear and tear allowance, 1930-31	£17	
Deduct amount received on sale	£66	
	—	83
Obsolescence allowance		£17

As only one half of the expenditure can be deducted for income tax purposes—a ratio which appears to be not unreasonable—the income tax obsolescence allowance for 1931-32 will be £23 10s, in addition to the 15 per cent allowance on the new car—that is, 15 per cent of £140=£21

Interest on Unpaid Purchase Money

"AJAX" inquires what is the correct procedure where B purchases a part of A's practice and pays the amount of the purchase money in instalments, plus 5 per cent per annum on the unpaid instalments

*** B cannot claim any deduction in respect of the interest payments, on the other hand, he will have to account to the Revenue for tax thereon at the full standard rate But he is entitled to deduct tax at that rate from the interest when paying it to A, and A should therefore include the amounts in his statement of *total* income as having been taxed before receipt.

LETTERS, NOTES, ETC.

Prolongation of Menstrual Life

DR P W L ANDREW (Boxhill) writes I am attending an old lady, 80 years of age, who first started to menstruate at the age of 12, She is married, and has had 11 living children, 3 stillborn, and 4 miscarriages Her last was born when she was 46 years of age Since then she has been absolutely regular, going twenty eight days with a loss lasting three to four days, up to about five years ago Now the loss is one to two days only, but quite regular, and, strange to say, occasionally accompanied by a certain amount of flooding, which is corrected by ergot and iron

"American Heart Journal"

DR MAURICE CAMPBELL (Hon Wills Librarian, Guy's Hospital, S E) writes I should be grateful if any of your readers can help me to obtain the following volumes of the *American Heart Journal* for the library at Guy's Hospital We have made every effort to buy them through trade sources, here and in America, without success, and the only volumes are out of print It may be that someone who does not wish to bind them has these spare parts, and is willing to sell them, if so, I shall be glad if he will write to me The missing volumes are vol I, Part III, vol II, Part III

Symbols of Sex

"W E H" writes on the subject of Dr Gregory Kayne's note (December 6th p 986) The symbol ♂ of the male sex represents the spear and shield of Mars, that ♀ of the female is the mirror of Venus They descend to us from the alchemists

New Driving Licences

THE legal department of the Automobile Association will send free of charge to any motorist a copy of the new Regulations governing the issue of driving licences and the physical fitness of applicants Requests should be addressed to the A A, Fanum House, New Coventry Street, London, W 1

Directory of Masseurs in Private Practice

MR J STEWART BROWN, secretary of the Private Practitioners' Association (an association of registered members of the Chartered Society of Massage and Medical Gymnastics in private practice), writes to say that the *Directory*, recently published and announced in our columns (October 25th p 715) is free to medical practitioners, and will be sent on request to all doctors interested His address is 'Hygeia,' Falmouth

Vacancies

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals will be found at pages 46, 47, 48, 49 50, 51, 54, and 55 of our advertisement columns, and advertisements as to partnerships, assistantships and locumtenencies at pages 52 53, and 54

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 209

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine

518 Etiology of Constipation

BLCART (*Bull et Mem Soc de Med de Paris*, October 10th, 1930, p 404) defines the constipated subject as one who fails to have a stool at least once in the twenty four hours or has an incomplete evacuation, although he admits that perfect health may exist with the passing of a stool on alternate days only Discussing the anatomy and physiology of the intestinal tract (with some useful diagrams), he points out the resemblance between the sigmoid and the stomach as reservoirs while the oesophagus and rectum act as channels for the ingestion or expulsion of materials He then describes the function of the three parts of the colon and the mechanism of defaecation The daily stool represents what has been collected in the sigmoid during twenty four hours, and is not necessarily made up of the residue of food swallowed during that period Bécart draws attention to the piston like action of the sigmoid when it is invaginated into the rectum in the first stages of defaecation Constipation may be due to faulty e lucation the abuse of purgatives, improper food, or nervous factors The author comments at length on the abuse of strong purgatives and classifies as main types of constipation those due to colonic trouble (imperfect digestion, endocrine deficiencies colitis, and dolichocolon) and those due to mechanical difficulties in the rectum or sigmoid Where there is biliary insufficiency the administration of bile extracts o ten achieves excellent results Becart then gives clinical descriptions of different types of constipation paying par ticular attention to the neurotic female colitis patient Rectal examination is advisable, in addition to the usual routine abdominal investigation In treatment all aperients cannot be dismissed off hand, even though they may have done more harm than good in some cases It is essential to gain the patient s confidence and to persuade him that to miss passing a stool for a day or so is not as serious as he has come to believe Paraffin does harm in the constipation due to colitis Medicated suppositories are useful in the dyschesic cases, since they stimulate the rectal reflex

519 Psittacosis

M VOLTERRA (*Studium*, October 1st 1930 p 401) describes the clinical history of cases of psittacosis in persons who had not been directly in contact with parrots, but who had acquired the disease from association with other human cases The severity of the disease which clinically suggests a severe type of influenza accompanied by broncho pneumonia, is shown by its high mortality—30 to 40 per cent —especially among patients of more advanced age The etiology is not as yet defined, and though a few observers have isolated and described a Gram negative non lactose fermenting bacillus of Nocard, similar to *B aertrycke*, from the dead birds, it seems unlikely that this organism is the cause of the disease since other workers have failed to isolate it In the author s five cases cultures made in bile and broth from the blood and from the bone marrow after death were always negative Injections of blood into white mice which are usually killed by injections of Nocard s bacillus, were also negative The streptococcus obtained from some patients has not been found in the birds affected Since the recent epidemic an increasing number of observers have recovered a filterable virus from the organs and faeces of parrots dead from this disease It seems possible that apparently healthy birds may infect human subjects with psittacosis The author describes the post mortem findings in these cases and deals shortly with the general expectant therapy to be employed

520 Paroxysmal Auricular Fibrillation

J PARKINSON and M CAMPBELL (*Quart Journ Med*, October, 1930 p 67) report their experience of paroxysmal auricular fibrillation based upon notes of 200 patients, the nature of the irregularity being decided by graphic methods in two-thirds of the cases Though the provocative stimulus concerned was obscure the etiology was determined in 85 per cent 70 per cent showing structural heart disease due in equal proportions to rheumatism, high blood pressure and primary myocardial disease, while goitre was responsible for 15 per cent Palpitation breathlessness, and inability to work may be the only symptoms though in longer attacks all the signs of congestive heart failure may develop The authors group their cases in three main classes (1) typical recurrent paroxysms, accounting for more than half the cases, (2) a few paroxysms preceding the onset of established fibrilla tion and (3) single or very occasional paroxysms of longer duration occurring in the course of congestive failure, after coronary thrombosis, in infections, or without apparent cause The prognosis is said to be good for the immediate attack lasting only a couple of days, but persistence for a week renders permanent fibrillation more likely, and after a fortnight almost certain A paroxysm which has per sisted more than two or three hours will often be arrested by quinidine in 5-grain doses three times a day but in cases lasting for days rather than hours digitalis should be given If quinidine or other measures fail to relieve the attacks patients should be advised to try to endure them but if they prove unbearable digitalis must be administered to reduce their frequency Large doses may be given if it is necessary to induce a condition of permanent fibrillation from which some patients find relief The presence of a goitre may require surgical treatment and the authors regard the condi tion of paroxysmal fibrillation as a troublesome rather than a serious complication

521 Leucopenia and Intradermal Injection

F LASCH (*Wien Arch f inn Med*, September 1st 1930 p 343) has studied the leucopenia arising after intradermal injec tions of non specific substances in aged persons The effects of the excitation of the skin, which is not specific and can arise from mechanical and thermal influences, has been regarded by some as vagal in origin Thirty two patients between the ages of 61 and 91 were injected intradermally with 4 c cm of 0 9 per cent sodium chloride Leucopenia occurred in thirteen and failed to appear in nineteen The effect com mences within five minutes after the injection, it increases up to thirty minutes, and then slowly disappears, and the white cell count has returned in one hour to nearly its original value In 7 cases quite independently of age, sex, or diagnosis, a pronounced leucocytosis followed the intra dermal injection and was succeeded by a fall to the original value in about an hour In some cases the fall of the white cell count was most marked in the neutrophils but in others the fall was not inconsiderable in the lymphocytes In all cases the blood pressure fell after the injection by 5 to 10 mm of Hg, and returned to its original value at the end of the experiment In younger subjects, if the leucopenic reaction failed the blood pressure did not fall In two cases with leucopenia after intradermal injection, 0 001 gram of atropine sulphate and on another day 0 01 gram of pilocarpine were injected subcutaneously into the opposite arm just previously to the intradermal injection In both cases the atropine hindered or diminished the leucopenia, the pilocarpine caused no change in one case, but in the other case there was a marked leucocytosis

Surgery.

522. Renal Rickets

H A SWART (*Journ of Bone and Joint Surg*, October, 1930, p 876) describes renal rickets as a disease entity which is characterized by renal insufficiency due to chronic interstitial nephritis and associated with bone deformities resembling rickets, such as knock knee, bending of the ribs and widening of the epiphyses The case is reported of a boy of 18 who gradually became unable to walk lost considerably in weight and height and acquired the appearance of a little old man with a dry, wrinkled, yellow skin X ray examination revealed a generalized process involving all the bones, which showed atrophy softening, and thickening of the epiphyseal lines The case was diagnosed as pyelonephritis associated with bony deformity resembling renal rickets and cod liver oil and sun baths were given No lasting benefit followed the treatment, and the boy died four months later after suffering from severe pain and being unable to excrete any urine Death was apparently caused by uraemia Swart comments on the rarity of the condition and the apparent lack of any helpful treatment An attempt should however be made to correct the renal condition but in cases of chronic interstitial nephritis this is futile and nothing can be done as regards the bony deformities before the nephritis has cleared up Osteotomy is almost invariably fatal The usual antirachitic measures and therapeutic aids are of no value in this condition It is suggested that the renal insufficiency may possibly stimulate the parathyroid gland to over activity, and thus produce the skeletal changes

523 Lower Limb Surgery in Diabetes Mellitus

L. S. MCKITTRICK and F. C. PRATT (*Arch. of Surg.*, October, 1930, p. 555) give the result of 281 operations performed on the lower extremities of patients with diabetes mellitus. Lesions were found to be due either to infection, or to arterial insufficiency with or without infection. In cases with insufficiency of the arterial circulation no pulsation is present in the peripheral blood vessels, the foot is cold, blanches on elevation, and becomes red and shiny when dependent. There is frequently a sudden change of temperature at some point in the leg, osteomyelitis with gangrene is common, and pain is out of proportion to the local lesion. Local operations in this group are rarely successful and may be dangerous owing to septicaemia, which is caused in most cases by the *Staphylococcus albus*. Buerger hyperaemic exercises were found to be of great help in stimulating the circulation, but in cases where there is gangrene, osteomyelitis of a phalanx, recurring ulcer, or pain without actual gangrene, amputation must be carried out, as also in cases where there is extensive infection. Spinal anaesthesia was found to be the most satisfactory, ether or chloroform should never be used. The 281 operations gave a mortality rate of 11·6 per cent. Of these, the mortality in 119 major amputations for conditions primarily due to arterial insufficiency was 17·6 per cent., and in 19 amputations primarily due to infection it was 10·5 per cent. Early and proper treatment of the surgical lesions will prevent many deaths from pre-operative and post-operative septicaemia, which was the cause of death in 50 per cent. of cases.

524 Primary Carcinoma of the Ureter

R. ASCOLI (*Arch. Ital. di Urol.*, October, 1930, p. 611), who records an illustrative case, states that all authorities are agreed that primary tumour of the ureter is rare, only thirteen cases having been collected by Albarran and Imbert, as compared with 585 cases of tumour of the renal parenchyma, which form only 2 per cent. of tumours in general. Volante collected thirty-eight cases of primary carcinoma of the ureter in 1927, since when at least two more have been recorded, by Gottlieb and Gruenebeig respectively. The three typical symptoms are haematuria, pain, which may be colicky, constant, or lancinating, and the presence of a tumour. Among seventeen cases collected by Jeanbrau the first symptom was pain in eight, the presence of a tumour in two, and haematuria in five, this last was the only symptom in three, and in two was accompanied by the presence of a tumour. In Ascoli's case, which occurred in a man aged 70, haematuria was the only symptom. Death took place from uraemia without operation, which was contraindicated by the general condition of the patient. At the post-mortem examination a papilliferous carcinoma in a very early stage of development was found in the right ureter just above the bladder, as well as a severe condition of bilateral ascending pyelonephritis, which was the cause of death.

525 Sprangel's Transverse Abdominal Incision

E. JUVARA (*Bull. et Mém. Soc. Nat. de Chir.*, October 15th, 1930, p. 1019) discusses the various abdominal incisions, and recommends the transverse one of Sprengel as being the most satisfactory. This incision may be made either in the epigastric angle or just below the subcostal margin, the latter offering the greater advantages from the point of view of light, space, exposure of the operative field, and also of the subsequent reconstruction of the abdominal wall. The operation is fully described, and the main points in which this incision is so satisfactory are stated as follows. It is quick and simple to make, and by extending the body of the patient the wound opens. Good access is obtained to the biliary passages, the pylorus, the duodenum, and the spleen. Moreover, the greater length of time required for the suture of the abdominal wall is more than compensated for by the saving of time in the operation itself. In cases of drainage the drain is better placed than in a median incision, since it lies directly over the biliary passages. The scar is well hidden in the folds of the skin and is very strong, no cases of abdominal weakness or nerve section having been seen after operation by this method. In cases of doubtful diagnosis a good view is provided, and the incision may be extended laterally if necessary, a case is quoted in which it was possible through the same incision to remove a blood cyst from the pancreas, and also to perform cholecystectomy.

526 Seasonal Incidence of Appendicitis

H. J. W. A. NIEUWENHUIZEN (*Nederl. Tijdschr. v. Geneesk.*, October 4th, 1930, p. 4876) states that in the middle of the nineteenth century several clinicians such as Burne, Platonow, Schlagtinger, and Materstock expressed the opinion that perityphlitis was most prevalent at certain seasons—namely, the end of the summer and the beginning of autumn, when digestive disturbances were most frequent, and also at Christmas, when there was a tendency to overeating. The first statistical investigation on this subject was carried out in 1894 by Rostowzow of St. Petersburg, who found that the majority of the appendicitis cases in the Obuchow Hospital were admitted in the winter, and the minority in the autumn and spring, whereas in the Peter and Paul Hospitals the minimum occurred in the winter. In 1920 Dubs of Winterthur found that the majority of his appendicitis cases during the period 1910–19 occurred in April. Dubs maintained that the weather was responsible for this, since in Switzerland the greatest variations in the temperature occurred in this month. Förster of Aarau, on the other hand, came to the conclusion that there was no connexion between the frequency of appendicitis and climatic factors. Nieuwenhuyzen made a study of 678 patients, 432 of whom were males and 246 females, admitted to the surgical clinic at Utrecht with appendicitis during the period January 1st, 1920, and January 1st, 1930, he found that the first attack in males occurred chiefly between the eleventh and twenty-fifth years and in females between the sixteenth and twentieth years. The month in which the attack of appendicitis was most frequent in both sexes was May, while the minimum occurred in February and April.

Therapeutics.

527 Dietetic Treatment in Diabetes

I. M. RABINOWITCH (*Canadian Med. Assoc. Journ.*, October, 1930, p. 489) records his experiences with a new form of diet in diabetes, these clearly demonstrated that, for a time at least, it is possible to replace the older diets of relatively high fat-low carbohydrate with diets of high carbohydrate content and of practically equal calorie value, not only with no disturbance of carbohydrate metabolism, but apparently with benefit. This applies whether the patients do or do not require insulin. Further investigation is indicated in order to determine the permanency of the effects of these diets. The literature on diabetic diets is reviewed by the author, and three cases are cited, which led to the trial of a diet not only high in carbohydrates but of calorie value designed to maintain a state of under nutrition. The following effects were noted. The patients are satisfied, and the diets eliminate the necessity of special foods, such as bran muffins and gelatins, which, when continued for a long period, become distasteful. Hyperglycaemia and glycosuria are more readily controlled whether insulin is given or not, and therefore insulin patients should be able to reduce the dosages, either in amount or frequency. In all but one of 17 cases on this diet the urine remained free from sugar and acetone bodies. In 8 the blood sugar figures were normal, they were slightly increased in 7, and in only 2 have they risen above 0·2 per cent. A most characteristic finding is said to be lowering of the blood cholesterol, and of nitrogen retention in the early stages. High blood cholesterol figures are indicative of disturbed fat metabolism, the higher they rise the greater is the tendency to complications, particularly acidosis. The respiratory metabolism shows a gradual increase of the quotient in the fasting state, suggesting an increased storage of carbohydrates. The diets are constructed in terms of units rather than weights, thus obviating the necessity of scales. A detailed list of the foods with the quantities allowed in this diet is given. The only danger mentioned is a temptation to use more butter than is prescribed, this would lead to a high calorie content and to overfeeding, with possibly dangerous sequels and a demand for more insulin. Rabinowitch emphasizes the point that this is an under nutrition diet, the patients being kept about 5 to 6 lb. under weight, a condition quite compatible with comfort and the daily duties. Patients preferred this dietetic treatment to taking insulin.

528 A Glandular Oxytocic Agent.

J. S. DIASIO (*Med. Journ. and Record*, October 15th, 1930, p. 399) calls attention to the value of thymophysin, a combination of thymus and posterior pituitary extracts, as a safe and reliable oxytocic preparation. Having used it in thirty-one cases, he found that it definitely assisted the dilatation of the cervix without having any ill effect upon either the mother or the child. Injected intramuscularly into the gluteal region, its action became apparent in from five to twenty-five minutes, producing strong, regular pains increasing in force and frequency. Its effects were milder but more persistent than those of pituitary extract alone, the spontaneous expulsion of the placenta occurring within a few minutes of delivery without any undue bleeding. Prolonged labour and weak pains are the main indications for its use. Diasio gave 1 c.cm. in his first six cases, but reduced the dose to 0·5 c.cm. in the subsequent twenty-five, on only five occasions was repetition required. He concludes that forceps were rendered unnecessary in 75 per cent. of the cases where their use had appeared

to be indicated One of the most satisfactory features of this procedure is that the drug can be given during the first stage of labour, while the dilatation of the cervix is between 1 and 4 cm It is contraindicated where there is disproportion between the size of the child and the pelvis, and in the presence of cardiac or renal disease hydramnios malformations, or marked exhaustion of the patient The author adds that evidence is obtainable from the literature as to the endocrinological significance of thymophysin which supports the view that thymus extract exerts a modifying influence upon the action of pituitary extract on the uterine musculature

529 The Pharmacology of Bromine Oils

C S SMITH and HELEN L WIKOFF (*Journ Lab and Clin Med*, October 1930 p 43) point out that not only have iodized oils been used in spinal, cisternal, and ventricular injections, but also in the diagnosis of thoracic disorders Their use, however is not without contraindications, Nichols particularly mentions in this connexion hypothyroidism idiopathic susceptibility to iodine and pulmonary tuberculosis These iodized oils usually also possess a higher viscosity and are less stable to heat than the corresponding bromine preparations In using oils containing bromine the possibility of inducing bromism must not be forgotten A series of experiments are recorded by the authors in which brominized esters of the fatty acids derived from cotton seed oil, and brominized sesame oil were administered to rabbits intratracheally and intraperitoneally The former were found to be the best for radiological work from both an economical and a chemical standpoint The oil was eliminated from the site of injection in these animals within a week Repeated doses of these esters produced no deleterious effects In another paper (ibid, p 36) Helen Wikoff describes the preparation and properties of some bromine oils and esters

530 Auto Immunization in Psoriasis

H S CAMPBELL and K FROST (*Arch Derm and Syph*, October 1930, p 685) in a preliminary report describe a new form of therapy for psoriasis—namely, intramuscular injections of a suspension in alcohol of the patient's own finely ground psoriatic scales, a suspension of approximately 0 2 gram of the scales to 20 c cm pure alcohol was used The doses ranged from 1 to 4 c cm the average being 1 5 c.cm, they were given at intervals of three or four days A series of fifteen patients was so treated and all responded but in varying degrees there was no untoward reaction, the objective changes being common to all though the duration of the reaction varied fairly widely The changes noted were thinning of the scales which became less adherent a gradual pealing of the centres of the lesions and a final stage of smooth slightly discoloured areas corresponding to the original lesion A few discrete psoriatic papules remained at the margin but they eventually disappeared It was noticed that between the first and second stages the scraping test was not followed by as free bleeding as that normally obtained although not constant, this was observed sufficiently regularly to be considered worthy of noting

Neurology and Psychology.

531 Psychoneurosis

DEFINING diseases in which the predominant cause is disturbance of the mind L K LUNT (*New England Journ of Med*, August 14th 1930 p 301) describes the psychoses as deviating more seriously from the normal, the patients being less able to undertake consistently the responsibilities of life The psychoneuroses, in which the mental function is less seriously involved are separable into four groups, according to the predominant symptoms Thus when the symptoms are essentially physical the psychoneurosis is of the neurasthenic type, when they are primarily disturbances of thoughts and feelings (obsessive fears and doubts) it is of the psychasthenic type closely related is the anxiety neurosis where excessive unreasonable fears and apprehensions predominate the fourth group includes hysteria with its manifold symptomatology The frequent attitude of both the laity and medical profession to this class of patients is deprecated It is pointed out that these conditions are true illnesses and that the symptoms are real and not imaginary When the diagnosis of a neurosis is made some emotional cause must be sought The case must be approached without antipathy or prejudice the patient must be given a sympathetic hearing and be encouraged to discuss his troubles The three main causes of most of the malfunctioning are fear the mating impulse and self assertion The main line of therapy is held by Lunt to be reorganization, which consists in persistently stimulating the patient to discard fallacious beliefs and in teaching him to respond more effectually Other factors in treatment are a detailed arrangement of daily activities balanced between work, not too much rest, appropriate exercise, and recreation An adequate diet must be maintained and medicine used only when really needed G P REYNOLDS (ibid, p 312) believes that the treatment of psychoneurosis is fundamentally based on explaining to the patient the evolution of his nervous symptoms from their original sources These sources are described as sexual disturbances fatigue neuroses unstable nervous equilibrium, environment, and physical disability Three points are emphasized by Reynolds for successful treatment the etiological factors must be carefully investigated in most cases some physical abnormality will be found to contribute to the neurosis the family doctor ought to be the best fitted to treat the case

532. Neurological Electro surgery

L DAVIS and B M GROSS (*Amer Journ Surg*, August 1930, p 207) record their experience in the use of electro-surgery, not only as a means of perfecting haemostasis in intracranial operations, but also as a direct aid in the treatment of certain types of lesions The meningiomas are most favourable for treatment because of their benign nature, even though they may attain enormous size and occur in situations difficult of access conditions resulting hitherto in their having been regarded as inoperable Gliomas, which constitute 42 per cent of all intracranial tumours, are more difficult to treat because of their gelatinous soft and spongy nature, but the removal of the block of cerebral tissue including the tumour is rendered easier by the coagulation of the cortical and subcortical vessels, so that the operation can be conducted in a comparatively avascular field In combination with the use of silver clips and suction apparatus, electro-surgery affords an additional means of keeping the plane of dissection dry although it is of little use in soft gelatinous tumour tissue, its addition to technique enables subcortical gliomas to be removed more radically and with greater safety Notes of cases are given illustrating the use of the method in coagulating surface vessels with a ball electrode, incising the cortex with a flat blade electrode, and piecemeal removal of the tumour with a loop electrode The authors conclude that with improved developments in its use electro-surgery will become the most valuable contribution to the surgery of the nervous system It does not as yet supersede the established principles of osteoplastic surgery, but it is of greatest use at present in the removal of meningiomas, particularly those relatively inaccessible

533. Etiology of General Paralysis of the Insane.

T D POWER (*Journ Mental Science*, July, 1930, p 524) remarks that no disease has a single cause and all manifestations which constitute disease are the result of a disturbance of equilibrium between the human organism and its environment Many factors play a part in producing this disharmony each varying in importance in different cases The author cites illustrations of the complex factors in the causation of diseases of microbic origin He considers that the soil is as important as the seed, and that in etiological studies the question of individual susceptibility should be considered The problems concerning the causation of general paralysis are approached along these lines The importance of psychopathic heredity in this disease, especially since the introduction of the Wassermann test has not received due attention Bolton found evidence of heredity in 81 9 per cent of seventy two general paralytics, he commented on the pathological similarity between general paralysis and senile dementia, and concluded that the ordinary sane person, the ordinary psychopath or potential lunatic if possessed of cortical neurones of average durability, might suffer from syphilis with impunity as regards the future onset of dementia paralytica By analogy with other mental disorders, Power reasons that the stock of the paretic is as important as that of the ordinary mental patient The syphilitic origin of general paralysis of the insane is undoubtedly established, but in most cases the early syphilitic signs are either very slight or totally absent These changes and the cerebrospinal fluid are briefly discussed. Power believes that the influence of alcoholism in the causation of dementia paralytica must not be ignored, and suggests that when the two toxins of syphilis and alcohol are acting simultaneously on the nervous system the one will reinforce the effects of the other and hasten the degenerative process The employment of arsenobenzol preparations in the treatment of syphilis has apparently only slightly reduced the incidence of general paralysis, and the author believes that such preparations are positively harmful in the treatment of so-called parasyphilitic diseases of the nervous system unless they are combined with some form of pyrexial therapy In conclusion, the questions are reviewed of the possible change in clinical character of dementia paralytica and of the duration of life in treated and untreated cases

Obstetrics and Gynaecology.

534 Radiography in Obstetrics and Gynaecology

J JARCHO (*Med Journ and Record*, October 15th, 1930, p 395) advocates the combined method of pneumo peritoneum and utero salpingography for the accurate determining of the contour, position, and size of the uterus, tubes, and ovaries, precise information with regard to neoplasms may often be similarly obtained. Following the investigation, patients should be kept in hospital for twenty four hours, since, especially in those receiving more than 1,000 c cm of gas, some shoulder pain and abdominal discomfort may result The author uses a combination of pneumo peritoneum with the subsequent injection of opaque iodized oil when additional information unobtainable by either method alone is needed, he has devised an apparatus—the pressometer with mano meter attachment—for the introduction of air or opaque media into the uterus, bladder, or kidneys A siphonometer of the Machlett type can be attached to it for the perabdominal or transuterine introduction of oxygen or CO_2 By such means normal and abnormal conditions of the pelvic viscera can be mapped out, and the inside and outside of the uterus be outlined, neoplasms of the uterus and adnexa are often clearly visible, and the diagnosis is thus rendered more precise The radiograms frequently indicate the existence of previously unsuspected conditions, and on several occasions bilateral ovarian cysts have been discovered when pelvic examination by experts had only suggested the existence of one Strict asepsis is necessary. The procedure can be carried out either by a radiologist or a gynaecologist, but preferably by both in co operation

535 Episiotomy

R A D GILLIS (*Amer Journ Surg*, September, 1930, p 520) discusses the advantages of episiotomy as a means of pre serving the pelvic floor during labour, he describes a simple method of suture resulting in primary healing with a satis factory end result in 500 consecutive cases Median episi otomy is preferable in the majority of cases because the incision passes through stronger structures, relieves the tension symmetrically, and is more satisfactory as regards reconstruction The wound is usually sutured immediately after delivery, while the patient is still anaesthetized and before the separation of the placenta, the later delivery of which produces no ill effects The introitus is retracted on either side, two or three twenty day catgut sutures are inserted deeply at right angles to the course of the muscle fibres and fascial planes to include the severed attachments of the levator bundles with the fascia and urogenital trigone These are clamped, while the vaginal mucosa is closed with interrupted or submucous catgut sutures to include the fascial plane beneath the mucosa, after this the deep sutures are tied, and the skin and superficial muscles and fascia are closed with interrupted silkworm gut There were only six infected wounds (1 2 per cent), and apparently there is no increase in the morbidity or risk of delivery That ordinary attempts to guard the perineum and prevent lacerations are inadequate is borne out by the large number of women who later require repair for injuries at childbirth, the opera tion of median or lateral episiotomy is advocated for their prevention

536 Intestinal Obstruction associated with Salpingitis

M R KAUFMANN (*Am Gynecol*, October, 1930, p 603) has collected nine cases in which intestinal obstruction was associated with a primary salpingitis, although the records of such cases are rare, such an association has been com mented upon by surgeons from time to time When this combination of circumstances does occur Kaufmann states that the syndrome is typical Anatomically, the peritubal peritonitis gives rise to an occlusion of the bowel by means of an inflammatory block This occlusion has to be dis tinguished from the paralytic one of pelvic peritonitis It is a subacute obstruction brought about by a salpingitis of moderate volume but of gradual increase in size The obstruction is mechanical and inflammatory Often the zone of adhesion is large, and there is a compact mass of inflammation which is beyond the possibility of operation The infection is always septic Predominating symptoms are ballooning of the abdomen, peristalsis, and repeated vomiting The intoxication has general symptoms which are recognizable as such Treatment resolves itself into a con sideration of the relative merits of such simple procedures as enterostomy, entero anastomosis, or iliac anus Simple laparotomy alone has proved successful, and hysterectomy which appears theoretically logical has had disastrous results The mortality is high, in general, it appears better to avoid touching the tubal mass The intoxication should be treated by intravenous saline injections

Pathology.

537 Bactericidal Action of Serous Fluids in Tuberculosis

P COURMONT and H GARDERIN (*Journ de Méd de Lyon*, October 20th, 1930, p 605) published in 1927 researches on the bactericidal action of the pleural fluid on tubercle bacilli. They now report the results of similar researches in the case of blood serum obtained from tuberculous patients For a long time this potentiality of blood serum has been recognized as an important factor in the defence of the organism against infection, but its study was retarded by the technical diffi culties attending the culture of tubercle bacilli in solid or liquid media The present authors have experimented with sero fibrinous pleural effusions, the blood plasma of tuberculous patients, and with normal serums from various animal species A culture of human tubercle bacilli is added to a series of tubes of broth containing progressively increas ing quantities of the serum to be tested A small quantity of serum only inhibits the bacillary growth for a certain time, larger doses of serum kill the bacilli This bactericidal power was found to be unaffected by a temperature of 132 F for half an hour, and it disappears only slowly as the age of the serum increases These characteristics differentiate the substance concerned from alexine, which is thermolabile and disappears rapidly from serums in a few days Filtra tion through Chamberland bougies (L3 and L5) reduces the bactericidal power by approximately one half. The authors classify cases in accordance with the bactericidal potency of their serums, they give details of 101 cases, and sum marize their conclusions as follows In tuberculous sero fibrinous pleurisies the fluid is usually strongly bactericidal, especially in favourable cases, in the graver cases this power is feeble The serum of tuberculous patients possesses a similar bactericidal power in varying degree, when it is strong a favourable progress is justifiable because clinical recovery often ensues When the bactericidal power is weak, however, the prognosis must be grave, the mortality being about 50 per cent There is therefore an evident correlation between a high bactericidal power and a favour able progress in cases of human tuberculosis, a very im portant practical point in prognosis Bactericidal power was found to exist normally in the serum of the majority of species of mammalia observed, but in greatly varying degree It is feeble among many susceptible species and very high among more resistant species such as the horse Thus this bactericidal activity appears to play a very important part in the defence of the organism against the tubercle bacillus. The active agent is very resistant to physical conditions and is thermostabile, it certainly differs from the alexine of the serum, exhibiting its effects *in vitro*, independently of the latter.

538 Liver Function Tests.

IN an organ with so many important functions as the liver the devising of satisfactory functional tests is difficult, since disturbance of one function may cause no interference with others The hepatic cells are not highly specialized, and each is apparently capable of performing many functions, much destruction of liver tissue can occur without seriously im pairing the functional integrity of the organ G M PIERSON (*Canadian Med Assoc. Journ.*, October, 1930, p 524) agrees with many other workers that most liver tests are of little value, he has found from experience with a large group of patients with various disorders that the following are the three most practical and clinically useful procedures the reten tion of bromsulphalein, the estimation of the serum bilirubin, particularly the determination of the icterus index, and the occurrence of urobilinogen in the urine The first named test is not an early indication of liver dysfunction When the retention occurs other tests are also positive, and no marked degree of retention was noted when the ordinary clinical evidences of liver disease were absent Serum bilirubin estimation is a more useful test, since it frequently indicates the presence of a latent icterus before liver disorders can be clinically recognized An increase in the urobilinogen was found to be the most delicate test of impaired function. Urobilinogen is increased even when damage to the liver parenchyma is very slight, and is permanently increased so long as any residual hepatitis remains It was the only positive test in certain cases in which liver disease was suspected but could not be proved clinically Pierson states that in all focal hepatic lesions, especially those with the biliary obstruction, functional tests yield no useful informa tion They are, however, of some aid in differentiating the various types of jaundice and in the diffuse hepatic disturb ances in which, by their means, the extent and duration of the liver damage can be estimated with some degree of accuracy, they are undoubtedly of prognostic value

THE FŒTUS AND VITAMIN D

THE GOULSTONIAN LECTURER for 1930, considering the significance to clinical medicine of studies in calcium and phosphorus metabolism, said of pregnancy "a high calcium diet of adequate vitamin content is required by pregnant and lactating women to allow for the drain of calcium into the fœtus and especially through the mother's milk"

It is doubtful whether the average diet contains completely adequate supplies of calcium and its controlling vitamin—vitamin D

Tasteless in itself and without any digestive drawbacks Ostelin vitamin D is controlled for potency to ensure its therapeutic efficacy

Ostelin vitamin D is physiologically standardised, and is available in combination with calcium in the following forms especially suited to the mother's requirements during pregnancy

1 OSTELIN TABLETS Ostelin with calcium glycero-phosphate gr ii

2 OSTELIN EMULSION The same in the form of emulsion

3 GLAX-OVO Supplies milk, with its natural lime salts vitamin D in the form of Ostelin the whole pleasantly flavoured with chocolate

The addition of any of these preparations to the mother's diet makes for lessened caries better health, and better lactation Of equal importance is the improvement in the general health of the child and the lessened liability to ailments associated with early childhood

Ostelin vitamin D is also incorporated in Sunshine Glaxo
a fully humanised milk food for infants

Free trials of any of these preparations may be had on application to Glaxo Laboratories 56, Osnaburgh Street London, N W 1

FAMOUS WINTER SPORTS EXPERTS at GAMAGES

To advise you in the selection of your Winter Sports kit, the most suitable resorts, hotels and travel facilities, the famous Zuber Bros. are in constant attendance, one at either Store They will be pleased to place the whole of their experience at your service, and to help you solve any problem

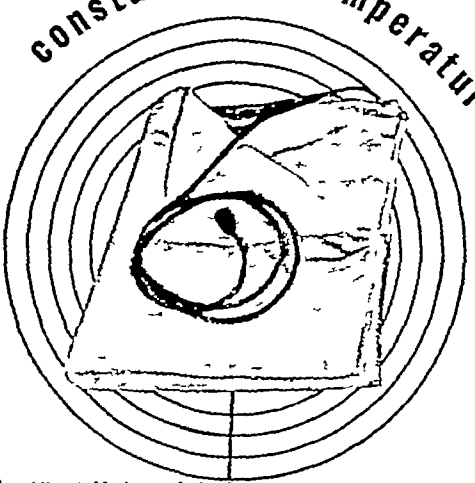
A PROVED PAIN RELIEVER

Thermogene owes its wide popularity mainly to its proved effectiveness in relieving pain This it does partly by gently stimulating the sensory nerve-endings partly by promoting a healthy collateral circulation and so lessening harmful congestion It entirely replaces the old fashioned poultice, so messy and fussy in its preparation and so dangerously "macerating" to the surrounding tissues The proof of Thermogene's efficiency is afforded by the relief it gives The patient, after all is the best judge of pain



Thermogene is a carefully prepared pure cotton wadding remarkably soft and fleecy freed from dust and other impurities and impregnated with skin-stimulating vegetable essences

THERMOGENE
MEDICATED WADDING

A full-size box of Thermogene with an interesting booklet on Surface Therapy will be sent FREE to any Medical Man who is unfamiliar with Thermogene and its many uses in practice The Thermogene Co Ltd Queen's Road Haywards Heath Sussex

constant bed temperature electrically maintained

With THERMEGA ELECTRIC BLANKETS and PADS constant regulated heat can be supplied to beds immediately from any wall plug or lamp socket on any voltage (100—250)

A THERMEGA BLANKET will warm and air a bed all through well within the hour Thus all risk of rheumatism is avoided. By means of the THERMEGA PAD steady warmth can be applied locally at a moment's notice, and maintained for as long as is desired. The pad is no larger than an ordinary hot water bottle.

Their average cost of current works out at ½d. an hour (at 6d. a unit) By a special Thermostat device the heat is constantly regulated and overheating made impossible Prices from 33/ complete

Rheumatic Cases Need Wool

The layman who wears woollen underwear knows that it is warm and comfortable, he is never conscious of the clammy feeling other underwear gives — wool is still comfortable after exercise

The facts are that medical evidence★ has proved that woollen underwear absorbs the damp of the body and holds it Even when there is a sudden change of temperature wool still holds the perspiration when other materials would let it condense back on to the skin

Against chills—or rheumatism if it is dreaded—wool is specially useful, allowing free perspiration, protecting against sudden excesses of heat or cold

When you mention woollen underwear you are safe in recommending Wolsey It is pure, soft and comfortably shaped to individual needs

★
Details of the investigation made by the British Research Association for Wool will gladly be sent to any medical practitioner on application to Wolsey Limited, Leicester
